RE: Johnson Controls Interiors L.L.C.

FCC ID: CB2UCONN

After a review of the submitted information, I have a few comments on the above referenced Application.

- 1) For permissive change applications, the conducted power is expected to be within 0.5 dB of the original conducted power. It appears that the conducted power in this application is a maximum 1.73 dBm, while the original application output power was 4.7 dBm. Note that since this is a delta of 3 dB, this would not be considered acceptable as a permissive change application. Please recheck the power measurements, software settings, etc. to ensure proper output levels. If the output power is not within 0.5 dB of the original, this application may require submittal under a new FCC ID.
- 2) Depending on the results of item 1 above, the spurious emissions may require retesting due to the difference in power output.
- 3) The results of item 1 above may affect section 6.7 of the test report and the RF exposure exhibit provided.
