KDB 680106 D01 RF Exposure Wireless Charging App v03

Human exposure to RF Low frequency emissions from portable devices (47 CFR § 2.1093) may be evaluated based on the MPE limits adopted by the FCC for electric and magnetic field strength and/or power density. According to the item 5.2 of KDB 680106 D01v03:

TCB Workshop and combine the actual situation of the EUT, For the portable wireless charger, RF exposure evaluation should be made from all sides(six sides) of EUT, with the 0cm to 20cm measured from the center of the probe to the edge of the EUT, in 2cm minimum increment.

E and H field strength measurements or numerical modelling may be used to demonstrate compliance.

Test Setup

Note: Measurements should be made from all sides and the top of the primary/client pair, the test distance of A, B, C, D, E, F side is 0cm to 20cm.

- 1) The RF exposure test was performed in anechoic chamber.
- 2) The highest emission level was recorded and compared with limit as soon as measurement of each points (A, B, C, D, E, F) were completed.
- 3) The EUT was measured according to the dictates of KDB 680106 D01 v03.

3.1 Assessment Result

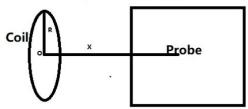

Note: All the mode have been tested, and only the worst case of mode are in the report.

And the result of test distance 2cm-20cm was measured value. According to Calibration information and specification about EHP-200A, The Probe EHP-200A's sensitive elements center are 8mm below the externa surface, and the dimensions is 92x92x109mm, so the actuacm field strenaths need to be estimated for the positions that are not reachable. The Extrapolated Value Calculation Method please below).

Estimated method for portable RF Exposure condition:

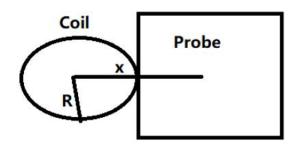

We use Biot-Savart formula theory to estimate the strength of the magnetic field that the measuring instrument cannot measure. According to Biot-Savart formula:

Top & Bottom Side:

$$B = \frac{\mu_0 * I * N * R^2}{2 * (R^2 + x^2)^{3/2}}$$

Front, left, right & rear Side:

$$B = \frac{\mu_0 * I * N}{2 * x}$$

B: means H-field value.

Uo is space permeability; u0=4T*10-7:

I:A current element passing through a coil:

R: means the Radius of coil(We can get the minimum R=0.021m);

Test Distance: The distance from the sensing element of the probe to the edge of the devicesurface x: means the center of the coil to the sensing elements of the probe. (For top & bottom side: x=test distance. Foiother side: x=test distance+R)

N: Number of turns, according to providing "Antenna specification" files: N=10

For validation purposes: If the value to show a 30% agreement between the mode and the (E- and/or H-field) probemeasurements for the two closest points to the device surface, and with 2cm increments. Then this extrapolation method is reasonable.

Note:

The percent ratio of agreement is the diference between the estimated and measured values divided bythe average of the estimated and measured values.
