#### 1.2 MEASUREMENT UNCERTAINTY

Where relevant, the following measurement uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2:

| No.  | Item                            | Measurement Uncertainty |
|------|---------------------------------|-------------------------|
| 1    | Conducted emission test         | +/-2.7 dB               |
| 2    | Radiated emission 9kHz-30MHz    | +/-5.6 dB               |
| 3    | Radiated emission 30MHz-1GHz    | +/-4.6 dB               |
| 4    | Radiated emission 1GHz-18GHz    | +/-4.4 dB               |
| 5    | Radiated emission 18GHz-40GHz   | +/-5.1 dB               |
| 6    | RF power                        | +/-0.9 dB               |
| 7    | Power Spectral Density          | +/-0.8 dB               |
| 8    | Conducted spurious emissions    | +/-2.7 dB               |
| 9    | Transmission Time               | +/-0.27%                |
| 10   | Occupied Bandwidth              | +/-1.86%                |
| Rema | rk: 95% Confidence Levels, k=2. |                         |

Only the measured values related to their corresponding limits will be used to decide whether the equipment under test meets the requirements of the test standards listed.

The measurement uncertainty is mentioned in this test report, but is not taken into account - neither to the limits nor to the measurement results. Measurement results with a smaller margin to the corresponding limits than the measurement uncertainty have a potential risk of more than 5% that the decision might be wrong.

Test Report No.: FCCSZ2025-0012-RF2 Page 9 of 39

### 1.3 TEST LOCATION

The tests and measurements refer to this report were performed by EMC testing Lab. of CVC Testing Technology (Shenzhen) Co., Ltd.

Lab Address: No. 1301-14&16, Guanguang Road, Xinlan Community, Guanlan Subdistrict, Longhua

District, Shenzhen, Guangdong, China

Post Code: 518110 Tel: 0755-23763060-8805 Fax: 0755-23763060 E-mail: sz-kf@cvc.org.cn FCC(Test firm designation number: CN1363) IC(Test firm CAB identifier number: CN0137) CNAS(Test firm designation number: L16091) Test Report No.: FCCSZ2025-0012-RF2 Page 10 of 39

### 2 GENERAL INFORMATION

### 2.1 GENERAL PRODUCT INFORMATION

|                         |  |  |  |

#### Note:

- 1. For more detailed features description, please refer to the manufacturer's specifications or the User's Manual.
- 2. For the test results, the EUT had been tested with all conditions. But only the worst case was shown in test report.
- 3. EUT photo refer to the report (Report NO.: FCCSZ2025-0012-EUT).
- 4. Since the above data and/or information is provided by the client, CVC is not responsible for the authenticity, integrity and results of the data and information and/or the validity of the conclusion.
- 5. The EUT have SISO function, provides 1 completed transmitter and 1 receiver.

2. By means of test software which provided by manufacture, the power levels during the tests were set

Test Report No.: FCCSZ2025-0012-RF2 Page 12 of 39

# 2.3 TEST MODE APPLICABILITY AND TESTED CHANNEL DETAIL

Pre-scan has been conducted to determine the worst-case mode from all possible combinations between available modulations, data rates, xyz axis and antenna ports

The worst case was found when positioned on xaxis for radiated emission. Following channel(s) was (were) selected for the final test as listed below:

GFSK,  $\pi/4$  DQPSK, 8DPSK was tested, the APCM of .GFSK,  $\pi/4$  DQPSK, 8DPSK was recorded. The the radiated emission of GFSK was worst,the report only present the results.

Test Report No.: FCCSZ2025-0012-RF2 Page 14 of 39

### 2.4 GENERAL DESCRIPTION OF APPLIED STANDARDS

The EUT is a RF product, according to the specifications of the manufacturers. It must comply with the requirements of the following standards:

FCC PART 15, Subpart C. Section 15.247 KDB 558074 D01 15.247 Meas Guidance v05r02 ANSI C63.10-2013

All test items have been performed and recorded as per the above standards

### 2.5 DESCRIPTION OF SUPPORT UNITS

The EUT has been tested as an independent unit together with other necessary accessories or support units. The following support units or accessories were used to form a representative test configuration during the tests.

| during | during the tests. |                      |               |                         |                       |                                       |             |  |

# 3 TEST TYPES AND RESULTS

#### 3.1 CONDUCTED EMISSION MEASUREMENT

#### 3.1.1 Limit

| Frequency  | Conducted Limits(dBμV) |           |  |  |  |
|------------|------------------------|-----------|--|--|--|
| (MHz)      | Quasi-peak             | Average   |  |  |  |
| 0.15 - 0.5 | 66 to 56 *             | 56 to 46* |  |  |  |
| 0.5 - 5    | 56                     | 46        |  |  |  |
| 5 - 30     | 60                     | 50        |  |  |  |

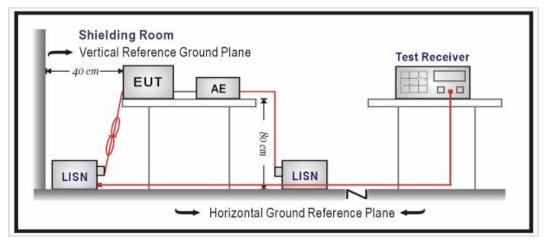

NOTE: 1. The lower limit shall apply at the transition frequencies.

NOTE: 2. The limit decreases in line with the logarithm of the frequency in the range of 0.15 to 0.50MHz.

# 3.1.2 Measurement procedure

- a. The EUT was placed on a platform of nominal size, 1 m by 1.5 m, raised 80 cm above the conducting ground plane. The vertical conducting plane was located 40 cm to the rear of the EUT. All other surfaces of EUT were at least 80 cm from any other grounded conducting surface. The EUT and simulators are connected to the main power through a line impedance stabilization network (LISN). The LISN provides a 50 ohm /50uH coupling impedance for the measuring equipment. The peripheral devices are also connected to the main power through a LISN. (Please refer to the Test photographs) Each current-carrying conductor of the EUT power cord, except the ground (safety) conductor, was individually connected through a LISN to the input power source. The equipment under test shall be placed on a support of non-metallic material, the height of which shall be 1.5m above the ground,
- b. The excess length of the power cord between the EUT and the LISN receptacle were folded back and forth at the center of the lead to form a bundle not exceeding 40 cm in length.
- c. Conducted emissions were investigated over the frequency range from 0.15MHz to 30MHz using a receiver bandwidth of 9 kHz.

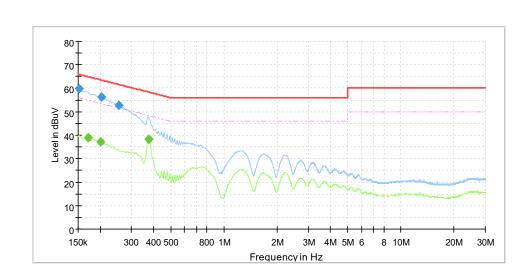

# 3.1.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 16 of 39

#### 3.2 RADIATED EMISSIONS

#### **3.2.1 Limits**

Radiated emissions which fall in the restricted bands, as defined in Section 15.205(a), must also comply with the radiated emission limits specified in Section 15.209(a). Other emissions shall be at least 20dB below the highest level of the desired power.

| FREQUENCIES (MHz) | FIELD STRENGTH (Microvolts/Meter) | MEASUREMENT DISTANCE (Meters) |
|-------------------|-----------------------------------|-------------------------------|
| 0.009 ~ 0.490     | 2400/F(kHz)                       | 300                           |

| 88 ~ 216          | 150                               | 3                             |
| 216 ~ 960         | 200                               | 3                             |
| Above 960         | 500                               | 3                             |

NOTE: 1. The lower limit shall apply at the transition frequencies.

NOTE: 2. Emission level (dBuV/m) = 20 log Emission level (uV/m).

NOTE: 3. As shown in 15.35(b), for frequencies above 1000MHz, the field strength limits are based on average detector, however, the peak field strength of any emission shall not exceed the maximum permitted average limits, specified above by more than 20dB under any condition of modulation.

#### 3.2.2 Measurement procedure

- a. The EUT was placed on the top of a rotating table 1.5 meters(above 1GHz) and 0.8 meters(below 1GHz) above the ground at a 3 meters semi-anechoic chamber. The table was rotated 360 degrees to determine the position of the highest radiation.
- b. The EUT was set 3 meters away from the interference-receiving antenna, which was mounted on the top of a variable-height antenna tower.
- c. For below 1GHz was used bilog antenna, and above 1GHz was used horn antenna, and its height is varied from one meter to four meters above the ground to determine the maximum value of the field strength. Both horizontal and vertical polarizations of the antenna are set to make the measurement.
- d. For each suspected emission, the EUT was arranged to its worst case and then the antenna was tuned to heights from 1 meter to 4 meters and the rotatable table was turned from 0 degrees to 360 degrees to find the maximum reading.
- e. The test-receiver system was set to Peak Detect Function and Specified Bandwidth with Maximum Hold Mode.
- f.For below 30MHz, a loop antenna with its vertical plane is place 3m from the EUT and rotated about its vertical axis for maximum response at each azimuth about the EUT. And the centre of the loop shall be 1m above the ground.
- g. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, For battery operated equipment, the equipment tests shall be perform using fresh batteries. The turntable was rotated to maximize the emission level.

Test Report No.: FCCSZ2025-0012-RF2 Page 19 of 39

#### NOTE:

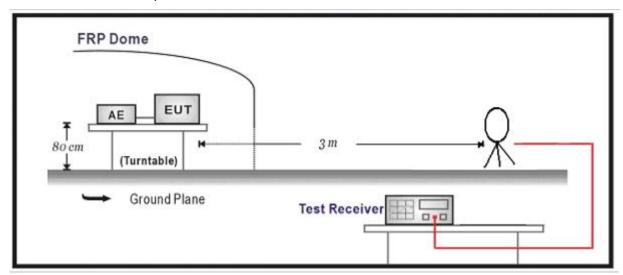

- 1. The resolution bandwidth and video bandwidth of test receiver/spectrum analyzer is 120kHz for Quasi-peak detection at frequency below 1GHz.
- 2. The resolution bandwidth of test receiver/spectrum analyzer is 1 MHz and video bandwidth is 3MHz for Peak detection at frequency above 1GHz.
- 3. The resolution bandwidth of test receiver/spectrum analyzer is 1MHz and the video bandwidth is ≥ 1/T (Duty cycle < 98%) or 10Hz(Duty cycle > 98%) for Average detection (AV) at frequency above 1GHz.
- 4. All modes of operation were investigated and the worst-case emissions are reported.
- 5. The testing of the EUT was performed on all 3 orthogonal axes; the worst-case test configuration was reported on the file test setup photo.

- 2. Level (dBuV/m) = Reading (dBuV) + Factor (dB/m).
- 3. Factor (dB/m) = Antenna Factor (dB/m) + Cable Factor (dB).
- 4. Margin(dB) = Limit[dB $\mu$ V/m] Level [dB $\mu$ V/m]

Test Report No.: FCCSZ2025-0012-RF2 Page 29 of 39

#### 3.3 NUMBER OF HOPPING FREQUENCY USED

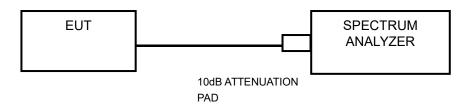

#### **3.3.1 Limits**

At least 15 channels frequencies, and should be equally spaced.

## 3.3.2 Measurement procedure

- a. Check the calibration of the measuring instrument (SA) using either an internal calibrator or a known signal from an external generator.
- b. Turn on the EUT and connect its antenna terminal to measurement via a low loss cable. Then set it to any one measured frequency within its operating range and make sure the instrument is operated in its linear range.
- c. Set the SA on MaxHold Mode, and then keep the EUT in hopping mode. Record all the signals from each channel until each one has been recorded.
- d. Set the SA on View mode and then plot the result on SA screen.
- e. Repeat above procedures until all frequencies measured were completed.

#### 3.3.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 30 of 39

#### 3.4 DWELL TIME ON EACH CHANNEL

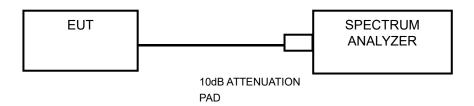

#### **3.4.1 Limits**

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

#### 3.4.2 Measurement procedure

- a. Check the calibration of the measuring instrument (SA) using either an internal calibrator or a known signal from an external generator.
- b. Turn on the EUT and connect its antenna terminal to measurement via a low loss cable. Then set it to any one measured frequency within its operating range and make sure the instrument is operated in its linear range.
- c. Adjust the center frequency of SA on any frequency be measured and set SA to zero span mode. And then, set RBW and VBW of spectrum analyzer to proper value.
- d. Measure the time duration of one transmission on the measured frequency. And then plot the result with time difference of this time duration.
- e. Repeat above procedures until all different time-slot modes have been completed.

#### 3.4.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 31 of 39

#### 3.5 20DB EMISSION BANDWIDTH

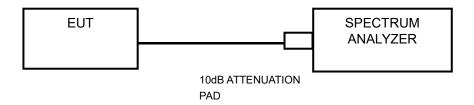

#### 3.5.1 **Limits**

For frequency hopping system operating in the 2400-2483.5MHz, If the 20dB bandwidth of hopping channel is greater than 25kHz, two-thirds 20dBbandwidth of hopping channel shell be a minimum limit for the hopping channel separation

#### 3.5.2 Measurement procedure

- a. Check the calibration of the measuring instrument using either an internal calibrator or a known signal from an external generator.
- b. Turn on the EUT and connect it to measurement instrument. Then set it to any one convenient frequency within its operating range. Set a reference level on the measuring instrument equal to the highest peak value.
- c. Measure the frequency difference of two frequencies that were attenuated 20dB from the reference level. Record the frequency difference as the emission bandwidth.
- d. Repeat above procedures until all frequencies measured were complete.

### 3.5.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 32 of 39

#### 3.6 HOPPING CHANNEL SEPARATION

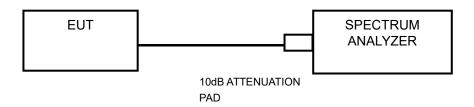

#### 3.6.1 **Limits**

At least 25kHz or two-third of 20dB hopping channel bandwidth (whichever is greater).

## 3.6.2 Measurement procedure

- a. Span: Wide enough to capture the peaks of two adjacent channels.
- b. RBW: Start with the RBW set to approximately 30% of the channel spacing; adjust as necessary to best identify the center of each individual channel.
- c. Video (or average) bandwidth (VBW) ≥ RBW.
- d. Sweep: Auto.
- e. Detector function: Peak.
- f.Trace: Max hold.
- g. Allow the trace to stabilize.

#### 3.6.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 33 of 39

#### 3.7 CONDUCTED OUTPUT POWER

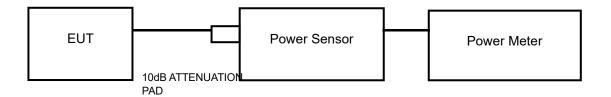

#### 3.7.1 Limits(FCC)

For frequency hopping systems operating in the 2400-2483.5 MHz band employing at least 75 non-overlapping hopping channels, and all frequency hopping systems in the 5725-5850 MHz band: 1 watt. For all other frequency hopping systems in the 2400-2483.5 MHz band: 0.125 watts.

#### 3.7.2 Measurement procedure

a. A peak power sensor was used on the output port of the EUT. A power meter was used to read the response of the peak power sensor and set the detector to PEAK. Record the power level.

# 3.7.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 34 of 39

#### 3.8 OUT OF BAND EMISSION MEASUREMENT

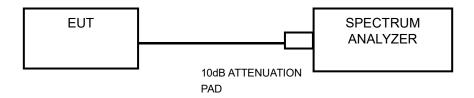

#### 3.8.1 **Limits**

Below -20dB of the highest emission level of operating band (in 100KHz RBW).

## 3.8.2 Measurement procedure

The transmitter output was connected to the spectrum analyzer via a low loss cable. of Spectrum Analyzer was set RBW to 100 kHz and VBW to 300 kHz with suitable frequency span including 100 MHz bandwidth from band edge. Detector = PEAK and Trace mode = Max Hold. The band edges was measured and recorded.

#### 3.8.3 Test setup

Test Report No.: FCCSZ2025-0012-RF2 Page 35 of 39

#### 3.9 OCCUPIED BANDWIDTH MEASUREMENT

#### 3.9.1 Measurement procedure

The transmitter antenna output was connected to the spectrum analyzer through an attenuator. The resolution bandwidth shall be set to the range of 1% to 5% of the anticipated emission bandwidth, and a video bandwidth at least 3x the resolution bandwidth.

below the lower and above the upper frequency limits, the mean powers emitted are each equal to a specified percentage 0.5 %of the total mean power of a given emission.

#### 3.9.2 TEST SETUP

Test Report No.: FCCSZ2025-0012-RF2 Page 36 of 39

#### 3.10 ANTENNA REQUIREMENT

#### 3.10.1 LIMITS

For intentional device, according to FCC 47 CFR Section 15.203, an intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. And according to FCC 47 CFR Section 15.247 (b), if transmitting antennas of directional gain greater than 6 dBi are used, the power shall be reduced by the amount in dB that the directional gain of the antenna exceeds 6 dBi.

#### 3.10.2 ANTENNA ANTI-REPLACEMENT CONSTRUCTION

The antenna used for this product is FPC Antenna and that no antenna other than that furnished by the responsible party shall be used with the device

#### 3.10.3 ANTENNA GAIN

The maximum peak gain of the transmit antenna is -1.99 dBi.
