TEST SUMMARY

5.1.1 VOLTAGE REQUIREMENTS

RESULT: PASS

5.1.2 ANTENNA REQUIREMENTS

RESULT: PASS

5.1.3 RESTRICTED BANDS OF OPERATION

RESULT: PASS

5.2.1 CONDUCTED MEASUREMENTS AT ANTENNA PORT

RESULT: PASS

5.2.2 6dB AND 99% BANDWIDTH

RESULT: PASS

5.2.3 PEAK POWER SPECTRAL DENSITY

RESULT: PASS

5.2.4 BAND EDGE CONDUCTED EMISSIONS

RESULT: Pass

5.2.5 RADIATED SPURIOUS EMISSIONS OF TRANSMITTER

RESULT: PASS

5.2.6 RADIATED SPURIOUS EMISSIONS OF TRANSMITTER IN RESTRICTED BANDS

RESULT: PASS

5.3.1 AC POWER LINE CONDUCTED EMISSION OF TRANSMITTER

RESULT: PASS

1. General Remarks

1.1 Complementary Materials

There is no attachment to this test report.

2. Test Sites

2.1 Test Facilities

The Federal Communications Commission and Industry Canada has reviewed the technical characteristics of the test facilities at TÜV Rheinland EPS B.V., located in Leek, 9351VT Eiberkamp 10, The Netherlands, and has found these test facilities to be in compliance with the requirements of 47 CFR Part 15, section 2.948.

The description of the test facilities has been filed at the Office of the Federal Communications Commission under registration number 90828. The facility has been added to the list of laboratories performing these test services for the public on a fee basis.

The description of the test facilities has been filed to Industry Canada under registration number 2932G-2. The facility has been added to the list of laboratories performing these test services for the public on a fee basis.

Normal test conditions:

Temperature (*)	: +15°C to +35°C
Relative humidity(*)	: 20 % to 75 %
Supply voltage	: 120VAC/60Hz
Air pressure	: 950 – 1050 hPa

When it was impracticable to carry out the tests under these conditions, a note to this effect stating the ambient temperature and relative humidity during the tests are stated separately.

3. General Product Information

3.1 Product Function and Intended Use

The brand Intel model 7260NGW, hereafter referred to as EUT, is a PCIe small form factor IEEE 802.11a/b/g/n/ac + Bluetooth wireless network adapter module. The module will support MIMO (2x2) for 802.11n/ac modes and MISO (1x2) for 802.11a/b/g modes and utilizes DSSS and OFDM modulation techniques. Bluetooth operates with basic, EDR and BLE modes as SISO (1x1). When Bluetooth is operational WiFi operates as SISO (1x1).

The module is sold under two different FCC ID numbers under the same model number (see table below). The FCC ID ending in "U" is intended to allow user installation conditions and host systems must be provided with a BIOS locking feature to provide mutual authentication between module and host devices.

Brand	Model Number	Description	FCC/IC IDs
Intel	7260NGW	802.11a/b/g/n/ac + BT wireless network adapter module	PD97260NG PD97260NGU 1000M-7260NG

The content of this report and measurement results have not been changed other than the way of presenting the data.

3.2 System Details

Details and an overview of the system and all of its components, as it has been tested, may be found below.

EUT	:	Wireless Network Adapter Module - Digital Transmission System (DTS)
Manufacturer	:	Intel Corporation
Brand	:	Intel
Model(s)	:	7260NGW
MAC address	:	001500B6698F
Voltage input rating	:	+3.3 V
Voltage output rating	:	--
Current input rating	:	--
Antenna	:	AUX3
Operating frequency	:	2412MHz-2462MHz, 5180MHz-5320MHz, 5500MHz-5700MHz, 5745MHz-5825MHz and 2402MHz-2480MHz.
Modulation	:	DSSS and OFDM
Remarks	:	n.a.

Test Report No.:

12121201.fcc01

4. Test Set-up and Operation Modes

4.1 Test Methodology

The test methodology used is based on the requirements of RSS-GEN, RSS-210, 47 CFR Part 15, Sections 15.31, 15.33, 15.35, 15.205, 15.207, 15.209, 15.247 and ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

The test methods, which have been used, are based on ANSI C63.10-2009.

For details, see under each test item.

4.2 Operation Modes

Modulation	Duty cycle	Antenna	Test frequencies (MHz)					
			Lowest	Power setting	Middle	Power setting	Highest	Power setting
1 Mb DSSS	0.99	1	2412	15.0	2437	15.0	2462	15.5
1 Mb DSSS	0.98	2	2412	17.5	2437	17.0	2462	17.0
6 Mb OFDM	0.99	1	2412	12.0	2437	17.5	2462	14.0
6 Mb OFDM	0.92	2	2412	14.0	2437	19.0	2462	14.5
HT4 - 20 MHz	0.99	1	2412	12.0	2437	18.5	2462	13.5
HT4 - 20 MHz	0.99	2	2412	13.5	2437	19.0	2462	14.5
HT8 - 20 MHz	0.98	1+2	2412	10.5/10.5	2437	11.0/11.0	2462	9.5/9.5
HT4 - 40 MHz	0.85	1	2422	9.5	2437	18.5	2452	13.0
HT4 - 40 MHz	0.85	2	2422	12.0	2437	19.0	2452	14.5/10.0
HT8 - 40 MHz	0.80	1+2	2422	6.5/11.0	2437	19.0/11.0	2452	10.0

Testing was performed at the lowest operating frequency, at the operating frequency in the middle of the specified frequency band and at the highest operating frequency. These operation modes were selected after review of the capabilities and characteristics of the EUT.

Antenna ports are also referred to as Chain A and Chain B, where chain A refers to Antenna-port 2 and Chain B refers to Antenna-port 1.

The data rates of 1Mb/s for 802.11b, 6Mb/s for 802.11g, HT4 (SISO)/HT8 (MIMO) for 802.11n20 and n40 were selected based on preliminary testing that identified those rates corresponding to the worst cases for output power and band edge levels at restricted bands.

Test Report No.:

12121201.fcc01

Page 13 of 263

The test software (see section 4.4) was used to define the following two operational modes of the EUT:

- Operational mode 1: Continuous transmit a data pattern with a duty cycle less than 100%.
- Operational mode 2: Continuous receive.

4.3 Physical Configuration for Testing

The EUT was installed into a test-fixture that interfaced to a laptop computer and dc power supply. The laptop computer was used to configure the EUT to continuously transmit at a specified output power and channel or continuously receive on the channel as specified in the testdata. See section 4.5 for Auxiliary details.

The EUT was tested on a stand-alone basis (only attached to the test jig) and the test system was configured in a typical fashion (as a customer would normally use it).

The justification and manipulation of cables and equipment in order to simulate a worst-case behavior of the test setup has been carried out as prescribed in ANSI C63.10-2009.

Figure 1: Test Setup Diagram

Notes:

For more details, refer to the document: Test Set-Up Photographs document.

Test Report No.:

12121201.fcc01

Page 14 of 263

4.4 Test Software

A continuous transmit or receive mode could be initiated by using test software as supplied by Intel Corporation. The test software was used to define various different operational modes of the EUT for the purpose of compliance testing. The version of the test software, as supplied by Intel Corporation and used during all tests is:

Test software : DRTU 1.6.0-0510
Driver : 16.0.0.17

This software was running on a laptop computer (AUX1). It was used to enable the test operation modes listed in section 4.2 as appropriate.

Test Report No.:

12121201.fcc01

4.5 Special Accessories and Auxiliary Equipment

The product has been tested together with the following additional accessories:

1. AUX1

Product: Laptop Computer
Brand: Lenovo
Model: 9456-HTG
Serial Number: L3-BF847 07/02
Remark: property applicant, host for testsoftware and AUX2

2. AUX2

Product: Test Jig
Brand: Intel
Model: NGFF Extension Rev. 01
Rated Voltage: 3.3 Vdc
Antenna: Internal, integrated on the PCB
Remarks: used for Antenna-port conducted tests

3. AUX3

Product: Reference antennas
Manufacturer: SkyCross Electronics (Shenzen) Co.,Ltd
Brand: SkyCross Electronics (Shenzen) Co.,Ltd
Gain at 2G4: 3.0 dBi (declared by applicant)
Remarks: used for radiated tests

Test Report No.:

12121201.fcc01

Page 16 of 263

5. Test Results

5.1 Technical Requirements

5.1.1 Voltage Requirements

RESULT: Pass

Requirements:

FCC 15.31(e)

For intentional radiators, measurements of the variation of the input power or the radiated signal level of the fundamental frequency component of the emission, as appropriate, shall be performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage. For battery operated equipment, the equipment tests shall be performed using a new battery.

Verdict:

The EUT has an internal voltage regulator to supply the RF circuit. Hence it complies with the power supply requirements.

5.1.2 Antenna Requirements

RESULT: Pass

Requirements:

FCC 15.203 and IC RSS-Gen section 7.1.2

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device.

Verdict:

The EUT has two non standard PIFA antenna connectors which complies with the requirements.

Test Report No.:

12121201.fcc01

Page 17 of 263

5.1.3 Restricted Bands of Operation

RESULT: Pass

Requirements:

FCC 15.205 and IC RSS-Gen section 7.2.2

Only spurious emissions are permitted in any of the restricted frequency bands, unless otherwise specified.

Verdict:

The EUT operation frequency range is 2412 MHz - 2462 MHz. Therefore only spurious emissions may be found in the restricted bands of operation and the EUT complies with the restricted frequency band requirement.

Test Report No.:

12121201.fcc01

Page 18 of 263

5.2 Conducted Measurements at Antenna Port

5.2.1 Conducted Output Power

RESULT: Pass

Date of testing: 2013-01-14 & 2013-03-15

Requirements:

FCC 15.247(b)(3)

For systems using digital modulation in the 2400-2483.5 MHz band, the maximum peak output power is 1W (+30dBm).

RSS-Gen: the e.i.r.p. shall not exceed 4 W (36 dBm).

Test procedure:

ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

The Peak Conducted Output Power was measured using the channel integration method according to option 2 in KDB 558074 D01.

The maximum peak output power (conducted) was measured at the antenna connector with a spectrum analyzer. The final measurement takes into account the loss generated by all the involved cables.

In the measure-and-sum approach for MIMO mode, the conducted emission level (e.g., transmit power or power in specified bandwidth) is measured at each antenna port. The measured results at the various antenna ports are then summed mathematically to determine the total emission level from the EUT. Summing is performed in linear power units (mW—not dBm).

The EIRP power (dBm) is calculated by adding the declared maximum antenna gain to the measured conducted power. For MIMO mode, the Guidance on directional Gain calculations according to the *Guidance for Emission Testing of Transmitters with Multiple Outputs in the Same Band 662911 D01 Multiple Transmitter Output v01r02 dated 9/26/2012* was used. The number of transmit antennas (NANT) are 2 and the number of spatial streams (Nss) are 2 and therefore the Array Gain is 0 dB.

Notes: $\text{mW} = 10^{(\text{dBm}/10)}$
 $\text{dBm} = 10 \times \log(\text{mW})$

5.2.2 6dB and 99% Bandwidth

RESULT: Pass

Date of testing:

2013-01-09 and 2013-03-13

Requirements:

FCC 15.247(a)(2) and RSS-210 Section A8.2(a)

For systems using digital modulation in the 2400-2483.5MHz band, the 6dB bandwidth shall be at least 500kHz.

For 99% Bandwidth: RSS-Gen Section 4.6.1: No requirement is given.

Test procedure 6dB bandwidth:

ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

A spectrum analyzer was connected to the antenna port of the EUT. The spectrum analyzer resolution bandwidth was set to 100kHz, video bandwidth to 300kHz and the span wide enough to capture the modulated carrier.

For 99% Bandwidth:

ANSI C63.10-2009 and RSS-Gen.

The transmitter shall be operated at its maximum carrier power measured under normal test conditions. The span of the analyzer shall be set to capture all products of the modulation process, including the emission skirts. The resolution bandwidth shall be set as close to 1% of the selected span as is possible without being below 1%. The video bandwidth shall be set to 3 times the resolution bandwidth. Video averaging is not permitted. Where practical, a sampling detector shall be used given that a peak or peak hold may produce a wider bandwidth than actual.

A spectrum analyzer was connected to the antenna port of the EUT. The spectrum analyzer resolution bandwidth was set to 1% of the selected span, Video bandwidth was set to 3 times the resolution bandwidth. The span was set to capture the whole modulation process. The Spectrum analyzers automated function for 99% BW was used.

Plots shown on the next pages are of the 6 dB bandwidth.

5.2.3 Peak Power Spectral Density

RESULT: Pass

Date of testing:

2013-01-12 / 2013-03-14

Requirements:

FCC 15.247(e) and RSS-210 section A8.2(b)

For digitally modulated systems, the power spectral density (PSD) conducted from the intentional radiator to the antenna shall not be greater than 8dBm in any 3kHz band during any time interval of continuous transmission.

Test procedure:

ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

The Peak PSD Option 1 procedure was used. A spectrum analyzer was connected to the antenna port of the EUT. The analyzer resolution bandwidth was set to 3kHz and the video bandwidth was set to 10kHz. The sweep time was set to auto couple and the trace was allowed to stabilize before making the final measurement. By using the Peak marker function the maximum amplitude was determined. The final measurement takes into account the loss generated by all the involved cables.

5.2.4 Band Edge Conducted Emissions

RESULT: Pass

Date of testing:

2013-01-12

Requirements:

FCC 15.205, FCC 15.209, FCC 15.247(d) and RSS-210 section A8.5

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, provided the transmitter demonstrates compliance with the peak conducted power limits.

Test procedure:

ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

Measurements were performed using a spectrum analyzer with a suitable span to encompass the peak of the fundamental and using the following settings:
RBW = 100kHz, VBW = 300kHz.

The highest emission amplitudes relative to the appropriate limit were measured and recorded in this report.

Results: All out of band spurious emissions are more than 20 dB below the fundamental.
See the figures on the following pages.

5.2.5 Radiated Spurious Emissions of Transmitter

RESULT: Pass

Date of testing: 2012-01-10

Frequency range: 30MHz - 25GHz

Requirements:

FCC 15.205, FCC 15.209 and FCC 15.247(d) and RSS-Gen

Radiated emissions which fall in the restricted bands, as defined in FCC 15.205(a), must comply with the radiated emission limits specified in FCC 15.209(a).

Radiated emissions which fall outside the operation frequency band and outside restricted bands shall either meet the limit specified in FCC 15.209(a) or be attenuated at least 20dB below the power level in the 100kHz bandwidth within the band that contains the highest level of the desired power (the less severe limit applies).

Test procedure:

ANSI C63.10-2009. ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

The EUT was placed on a nonconductive turntable 0.8m above the ground plane. Before final measurements of radiated emissions were performed, the EUT was scanned to determine its emission spectrum profile. The physical arrangement of the test system, the associated cabling and the EUT orientation (X, Y, Z) were varied in order to ensure that maximum emission amplitudes were attained.

The spectrum was examined from 30MHz to the 10th harmonic of the highest fundamental transmitter frequency (25GHz). Final radiated emission measurements were made at 3m distance.

At each frequency where a spurious emission was found, the EUT was rotated 360° and the antenna was raised and lowered from 1 to 4m in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations.

The highest emission amplitudes relative to the appropriate limit were recorded in this report. Field strength values of radiated emissions at frequencies not listed in the tables are more than 20 dB below the applicable limit.

Correction factors are incorporated in the spectrum analyzers as an automated function.

Refer to section 4.2 for the power settings and modes.

Correction factors includes: antenna factor, cable loss and pre-amplifier gain.

Test Report No.:

12121201.fcc01

Radiated Emission, Quasi Peak Data, 30MHz - 1GHz, Horizontal and Vertical Antenna Orientations

Freq. [MHz]	Antenna Orientation	Reading QP [dBµV]	Factor [dB(1/m)]	Level QP [dBµV/m]	Limit [dBµV/m]	Margin QP [dB]
66.86	Vertical	15.1	5.4	20.5	40.0	19.5
111.48	Vertical	13.6	11.4	25.0	43.5	18.5
253.10	Vertical	13.7	14.2	27.9	46.0	18.1
774.96	Vertical	14.7	24.8	39.5	46.0	6.5
844.80	Vertical	15.3	26.1	41.4	46.0	4.6
922.40	Vertical	15.4	27.6	43.0	46.0	3.0

Note:

- Level QP = Reading QP + Factor
- Tested in modes as described in section 4.2, highest values noted.

Preliminary measurements indicated that the radiated emissions from EUT were not affected by the EUT's operating frequency or mode (transmit versus receive mode).

- Quasi Peak detector used with a bandwidth of 120 kHz

5.2.6 Radiated Spurious Emissions of Transmitter in restricted bands

RESULT: Pass

Date of testing: 2013-01-10 and 2013-02-04

Frequency range: 4.5-5.15 GHz and 5.35-5.46 GHz

Requirements:

FCC 15.205, FCC 15.209 and FCC 15.247(d) and RSS-Gen

Radiated emissions which fall in the restricted bands, as defined in FCC 15.205(a), must comply with the radiated emission limits specified in FCC 15.209(a).

Test procedure:

ANSI C63.10-2009.

The EUT was placed on a nonconductive turntable 0.8m above the ground plane. Before final measurements of radiated emissions were performed, the EUT was scanned to determine its emission spectrum profile. The physical arrangement of the test system, the associated cabling and the EUT orientation (X, Y, Z) were varied in order to ensure that maximum emission amplitudes were attained.

The spectrum was examined from 4.5-5.15 GHz and 5.35-5.46 GHz. Final radiated emission measurements were made at 3m distance.

At each frequency where a spurious emission was found, the EUT was rotated 360° and the antenna was raised and lowered from 1 to 4m in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations.

The highest emission amplitudes relative to the appropriate limit were recorded in this report. Field strength values of radiated emissions at frequencies not listed in the tables are more than 20 dB below the applicable limit.

Correction factors are incorporated in the spectrum analyzers as an automated function.

Refer to section 4.2 for the power settings and modes.

Correction factors includes: antenna factor, cable loss and pre-amplifier gain.

5.3 Spurious emissions in receive mode

RESULT: Pass

Date of testing: 2013-01-10

Requirements: RSS-Gen

Radiated emissions from receiver shall not exceed the radiated limits in the table below.

Freq. [MHz]	Detector	Measurement Bandwidth	Limit [dB μ V/m]
30 – 88	Qp	120 kHz	40.0
88 – 216	Qp	120 kHz	43.5
216 – 960	Qp	120 kHz	46.0
Above 916	Av	1 MHz	54.0

Test procedure: ANSI C63.10-2009 and RSS-Gen section 4.10

The EUT was placed on a nonconductive turntable 0.8m above the ground plane. Before final measurements of radiated emissions were performed, the EUT was scanned to determine its emission spectrum profile. The physical arrangement of the test system, the associated cabling and the EUT orientation (X, Y, Z) were varied in order to ensure that maximum emission amplitudes were attained.

The spectrum was examined from 30 MHz to 7500 MHz. Emission measurements were made at 3m distance.

At each frequency where a spurious emission was found, the EUT was rotated 360° and the antenna was raised and lowered from 1 to 4m in order to determine the emission's maximum level. Measurements were taken using both horizontal and vertical antenna polarizations.

The 6 highest emission amplitudes relative to the appropriate limit were recorded in this report. Field strength values of radiated emissions at frequencies not listed in the tables are more than 20 dB below the applicable limit.

Correction factors are incorporated in the spectrum analyzers as an automated function. Correction factors includes: antenna factor, cable loss and pre-amplifier gain.

6. Test Set-up and Operation Modes

6.1 Test Methodology

The test methodology used is based on the requirements of RSS-GEN, RSS-210, 47 CFR Part 15, Sections 15.31, 15.33, 15.35, 15.205, 15.207, 15.209, 15.247 and ANSI C63.10:2009

KDB Publication No. 558074 D01: Measurement of Digital Transmission Systems Operating under Section 15.247.

The test methods, which have been used, are based on ANSI C63.10: 2009. For details, see under each test item.

6.2 Operation Modes

Modulation	Duty cycle	Antenna	Test frequencies (MHz)					
			Lowest	Power/ Gain control setting	Middle	Power/ Gain control setting	Highest	Power/ Gain control setting
6 Mb OFDM	0.99	1	5745	18.0 dBm	5785	17.5 dBm	5825	18.0 dBm
6 Mb OFDM	0.99	2	5745	31.0	5785	32.5	5825	31.5
HT4 - 20 MHz	0.94	1	5745	11.0 dBm	5785	10.5 dBm	5825	11.0 dBm
HT4 - 20 MHz	0.94	2	5745	11.0 dBm	5785	10.5 dBm	5825	11.0 dBm
HT8 - 20 MHz	0.98	1+2	5745	27.0	5785	27.5 / 27.5	5825	27.5
HT4 - 40 MHz	0.89	1	5755	17.5 dBm	--	--	5795	11.0 dBm
HT4 - 40 MHz	0.89	2	5755	17.5 dBm	--	--	5795	11.0 dBm
HT8 - 40 MHz	0.96	1+2	5755	11.5/11.5 dBm	--	--	5795	28.0/ 28.0
VHT6 – 80 MHz	0.79	1	--	--	5775	14.0 dBm	--	--
VHT6 – 80 MHz	0.79	2	--	--	5775	14.0 dBm	--	--
VHT6 – 80 MHz	0.79	1+2	--	--	5775	27.0/27.0	--	--

Test Report No.:

12121201.fcc01

Page 129 of 263

Power setting was established by either 'Power Control' or 'Gain Control' in the software as defined in section 4.4.

Testing was performed at the lowest operating frequency, at the operating frequency in the middle of the specified frequency band and at the highest operating frequency. These operation modes were selected after review of the capabilities and characteristics of the EUT.

Antenna ports are also referred to as Chain A and Chain B, where chain A refers to Antenna-port 2 and Chain B refers to Antenna-port 1. Gain control setting is for both chains equal were applicable.

The data rates of 6Mb/s for 802.11a, HT4 (SISO)/HT8 (MIMO) for 802.11n20 and n40, and VHT6 (SISO)/(MIMO) for 802.11 ac80 were selected based on preliminary testing that identified those rates corresponding to the worst cases for output power and spurious levels at the band edges.

6.3 Physical Configuration for Testing

The EUT was installed into a test-fixture that interfaced to a laptop computer and dc power supply. The laptop computer was used to configure the EUT to continuously transmit at a specified output power and channel or continuously receive on the channel as specified in the testdata. See section 4.5 for Auxiliary details.

The EUT was tested on a stand-alone basis (only attached to the test jig) and the test system was configured in a typical fashion (as a customer would normally use it).

The justification and manipulation of cables and equipment in order to simulate a worst-case behavior of the test setup has been carried out as prescribed in ANSI C63.10: 2009.

Figure 3: Test Setup Diagram

Notes:

For more details, refer to the document: Test Set-Up Photographs document.
