

Dear Tim,

I just uploaded a updated users manual to your website, please check.

And the data transmission is always initiated by software, which is then pass down through the MAC, through the digital and analog baseband, and finally to the RF chip. Several special packets (ACKs, CTS, PSpoll, etc...) are initiated by MAC. There are the only ways digital baseband portion will turn on the RF transmitter, which it then turns off at the end of the packet. Therefore, the transmitter will be on only while one of the aforementioned packets are being transmitted.

Thank you very much.

Best Regards,
Ivy
