RF Exposure Requirements

General information

Device type: A handheld video inspection device with Part 15 WIFI transceiver (802.11 g,n only) capable of operation on only one channel 2437 MHz. The conducted RF output power is 11.9 dBm or 16 mW.

Antenna

The integral antenna has a gain < 2 dBi.

Operating configuration and exposure conditions:

Photos on the subsequent pages show the position of the hands in relation to the product and a cutaway view of the product and the distance between the radiating structure and the hand. No duty cycle correction factor was taken in the calculation of minimum separation distance.

MPE Calculation:

The minimum separation distance is calculated as follows:

$$E(V/m) = \frac{\sqrt{30 \times P \times G}}{d} \quad \text{Power density: } P_d(mW/cm^2) = \frac{E^2}{3770}$$

The limit for general uncontrolled exposure environment is shown in FCC rule Part 1.1310, Table 1.
