1. Attestation of Test Results

Applicant Name	SAMSUNG ELECTRONICS CO., LTD.
FCC ID	A3LSMA166U
Model Name	SM-A166U, SM-A166U1, SM-S166V
Applicable Standards	FCC 47 CFR § 20.19 ANSI C63.19-2019
Date Tested	2024-09-30
Test Results	Pass

UL Korea, Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL Korea, Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties were not taken into account and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report..

Note: The results documented in this report apply only to the tested sample, under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL Korea, Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL Korea, Ltd. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by IAS, any agency of the Federal Government, or any agency of any government.

Approved & Released By: 	Prepared By:

TCB workshop updates

3. Facilities and Accreditation

The test sites and measurement facilities used to collect data are located at

Suwon
SAR 6 Room (HAC)

UL Korea, Ltd. is accredited by IAS, Laboratory Code TL-637.

The full scope of accreditation can be viewed at <https://www.iasonline.org/wp-content/uploads/2017/05/TL-637-cert-New.pdf>.

4. Calibration and Uncertainty

4.1. Measuring Instrument Calibration

The measuring equipment utilized to perform the tests documented in this report has been calibrated in accordance with the manufacturer's recommendations, and is traceable to recognized national standards.

Notes:

According to SPEAG's Technical Report, "MIF Verification", Doc # TR-FB-12.09.04-1, issued date: 9/4/2012. E-field probes are calibrated with specified uncertainty according to ISO 17025 as described in their calibration certificate. The MIF according to the definition in ANSI C63.19 is specific for a modulation and therefore can be used as a constant value if the probe has been PMR calibrated.

4.2. Measurement Uncertainty

Error Description	Explanation	Uncertainty value (±%) for ANSI C63.19-2019	Probe Dist.	Divisor	(Ci) E	Std. Unc.(±%) for ANSI C63.19-2019 E

3. Expanded Std. Uncertainty on Field is half value of Expanded Std. Uncertainty on power						

4.3. Decision Rule

Decision rule for statement(s) of conformity is based on Procedure 2, Clause 4.4.3 in IEC Guide 115:2021.

5. WD RF Emission Requirements

The WD's conducted power must be at or below either the stated **RF_{AIPL}** (**Table 4.1**) or the stated peak power level (Table 4.2), or the average near-field emissions over the measurement area must be at or below the stated **RF_{AIL}** (**Table 4.3**), or the stated peak field strength (Table 4.4).

The WD may demonstrate compliance by meeting any of these four requirements, but it must do so in each of its operating bands at its established worst-case normal speech-mode operating condition.

Table 4.1—Wireless device RF audio interference power level

Frequency range (MHz)	RF _{AIPL} (dBm)
<960	29
960–2000	26
>2000	25

>2000	41

6. System Specifications

E-field measurements are performed using the DASY8 automated dosimetric assessment system. The DASY8 is made by Schmid & Partner Engineering AG (SPEAG) in Zurich, Switzerland.

The DASY8 HAC Extension consists of the following parts:

Test Arch Phantom

The specially designed Test Arch allows high precision positioning of both the device and any of the validation dipoles.

EF3DV3 Isotropic E-Field Probe

Construction:	One dipole parallel, two dipoles normal to probe axis Interleaved sensors Built-in shielding against static charges PEEK enclosure material
Calibration:	In air from 30 MHz to 5.8 GHz (absolute accuracy $\pm 5.1\%$, $k=2$) ISO/IEC 17025 <u>calibration service</u> available.
Frequency:	30 MHz – 6 GHz; Linearity: ± 0.2 dB (100 MHz – 3 GHz)
Directivity:	± 0.2 dB in air (rotation around probe axis) ± 0.4 dB in air (rotation normal to probe axis)
Dynamic Range:	2 V/m to > 1000 V/m; Linearity: ± 0.2 dB
Dimensions:	Overall length: 337 mm (Tip: 20 mm) Tip diameter: 3.9 mm (Body: 12 mm) Distance from probe tip to dipole centers: 1.5 mm Sensor displacement to probe's calibration point: < 0.7 mm
Application:	General near-field measurements up to 6 GHz HAC measurements up to 6 GHz Field component measurements Fast automatic scanning in phantoms

7. System Validation

The test setup was validated when first configured and verified periodically thereafter to ensure proper function. The procedure provided in this section is a validation procedure using dipole antennas for which the field levels were computed by numeric modeling.

Procedure:

Place a dipole antenna meeting the requirements given in ANSI C63.19 in the normally occupied by the WD.

The dipole antenna serves as a known source for an electrical and magnetic output. Position the E-field probe so that the following occurs:

- The probes and their cables are parallel to the coaxial feed of the dipole antenna
- The probe cables and the coaxial feed of the dipole antenna approach the measurement area from opposite directions
- The center point of the probe element(s) is 15 mm from the closest surface of the dipole elements.

Scan the length of the dipole with the E-field probe and record the two maximum values found near the dipole ends. Average the two readings and compare the reading to the expected value in the calibration certificate or the expected value in this standard.

7.1. System Validation Results

SAR Lab	Date	Dipole Type_Serial #_Freq.	Dipole Cal. Due Data	Max. measured from		Avg. Emax (V/m)	Target (V/m) (From SPEAG)	Deviation (note 1) ± %	Plot No.
				Emax 1 (V/m)	Emax 2 (V/m)				
SAR 6	2024-09-30	CD835V3	1000	105.00	111.00	108.00	111.30	-2.96	1
SAR 6	2024-09-30	CD1880V3	1000	89.90	87.70	88.80	85.20	4.23	2
SAR 6	2024-09-30	CD2600V3	1009	84.20	83.20	83.70	86.00	-2.67	3
SAR 6	2024-09-30	CD3500V3	1011	82.60	83.70	83.15	83.30	-0.18	4

Notes:

- 1) Delta (Deviation) % = 100 * (Measured value minus Target value) divided by the Target value. Deltas within ±18% are acceptable, of which 12% is deviation and 13% is measurement uncertainty.
- 2) The maximum E-field were evaluated and compared to the target values provided by SPEAG in the calibration certificate of specific dipoles.
- 3) Please refer to the appendix for detailed measurement data and plots.

8. Evaluation for RF Audio Interference Power Level (RF_{AIPL})

An analysis shall be performed following the guidance of the RF air interface technology being evaluated. Factors that will affect the RF interference potential shall be evaluated, and the worst-case operating mode shall be identified and used in the evaluation. Any factor that can affect the RF interference potential shall be evaluated. Examples of such factors are those that will change the RF signal envelope, such as discontinuous transmission due to data load, power management, or configuration options of the RF air interface technology.

The primary method for establishing the RF interference potential of a WD is based on conducted power to the antenna. The waveform-specific modulation interference factor (MIF) is measured separately and added to the measured average conducted power, in dBm.

RF audio interference power level is compared to the limits in Sec.5 Table 4.1.

Air-Interface	Antenna	Average Antenna Input Power (dBm) ¹	Worst Case MIF (dB)	RF _{AIPL} (dBm)	RF _{AIPL} Limit (dBm)	HAC Tested
GSM 850	Ant.A	33.5	3.63	37.13	29	Measurement

LTE Band 48 UL CA	Ant.E	21.5	-1.44	20.06	25	Pass

Note(s):

1. Max tune-up limit.
2. All tests were performed with the transmit power set to the maximum power for held-to-head conditions (RCV active). For air interfaces with a Time Averaged SAR (TAS) algorithm P_{max} is considered the maximum power.
3. Testing for all UL CA is not required because it uses same Tx band, modulations, and output power is equal or less than non-CA modes.

Air-Interface	Antenna	Average Antenna Input Power (dBm) ¹	Worst Case MIF (dB)	RF _{AIPL} (dBm)	RF _{AIPL} Limit (dBm)	HAC Tested

WiFi 5GHz 802.11ac	Ant.D	16.0	-5.57	10.43	25	Pass

Note(s):

1. Max tune-up limit.
2. All tests were performed with the transmit power set to the maximum power for held-to-head conditions (RCV active). For air interfaces with a Time Averaged SAR (TAS) algorithm Pmax is considered the maximum power.

9. Modulation Interference Factor (MIF)

The HAC Standard ANSI C63.19 defines a new scaling using the Modulation Interference Factor (MIF) which replaces the need for the Articulation Weighting Factor (AWF) during the evaluation and is applicable to any modulation scheme.

The Modulation Interference factor (MIF, in dB) is added to the measured average E-field (in dBV/m) and converts it to the RF Audio Interference level (in dBV/m). This level considers the audible amplitude modulation components in the RF E-field. CW fields without amplitude modulation are assumed to not interfere with the hearing aid electronics. Modulations without time slots and low fluctuations at low frequencies have low MIF values, TDMA modulations with narrow transmission and repetition rates of few 100 Hz have high MIF values and give similar classifications as ANSI C63.19.

Definitions

E-field probes have a bandwidth <10 kHz and can therefore not evaluate the RF envelope in the full audio band. DASY8 is therefore using the “indirect” measurement method according to ANSI C63.19 which is the primary method. These near field probes read the averaged E-field measurement. Especially for the new high peak-to-average (PAR) signal types, the probes shall be linearized by probe modulation response (PMR) calibration in order to not overestimate the field reading.

The evaluation method of the MIF is defined in ANSI C63.19 section D.7. An RMS demodulated RF signal is fed to a spectral filter (similar to an A weighting filter) and forwarded to a temporal filter acting as a quasi-peak detector. The averaged output of these filtering is called to a 1 kHz 80% AM signal as reference. MIF measurement requires additional instrumentation and is not well suited for evaluation by the end user with reasonable uncertainty. It may alternatively be determined through analysis and simulation, because it is constraint and characteristic for a communication signal. DASY8 uses well defined signals for PMR calibration. The MIF of these signals has been determined by simulation and is automatically applied.

MIF values were not tested by a probe or as specified in the standards but are based on analysis provided by SPEAG for all the air interfaces (GSM, WCDMA, LTE, NR and Wi-Fi). The data included in this report are for the worst case operating modes. The UIDs used are listed below:

UID	Communication System Name	MIF (dB)
10021-DAC	GSM-FDD (TDMA, GMSK)	3.63
10011-CAC	UMTS-FDD (WCDMA)	-27.23
10170-CAF	LTE-FDD (SC-FDMA, 1 RB, 20 MHz, 16-QAM)	-9.76
10182-CAF	LTE-FDD (SC-FDMA, 1 RB, 15 MHz, 16-QAM)	-9.76
10176-CAH	LTE-FDD (SC-FDMA, 1 RB, 10 MHz, 16-QAM)	-9.76
10173-CAH	LTE-TDD (SC-FDMA, 1 RB, 20 MHz, 16-QAM)	-1.44
10934-AAC	5G NR (DFT-s-OFDM, 1 RB, 40 MHz, QPSK, 15 kHz)	-15.07
10931-AAC	5G NR (DFT-s-OFDM, 1 RB, 20 MHz, QPSK, 15 kHz)	-15.06
10930-AAC	5G NR (DFT-s-OFDM, 1 RB, 15 MHz, QPSK, 15 kHz)	-15.06
10929-AAD	5G NR (DFT-s-OFDM, 1 RB, 10 MHz, QPSK, 15 kHz)	-15.06
10973-AAD	5G NR (DFT-s-OFDM, 1 RB, 100 MHz, QPSK, 30 kHz) 5G NR (DFT-s-OFDM, 1 RB, 40 MHz, QPSK, 30 kHz)	-1.64
10061-CAB	IEEE 802.11b WiFi 2.4 GHz (DSSS, 11 Mbps)	-2.02
10077-CAB	IEEE 802.11g WiFi 2.4 GHz (DSSS/OFDM, 54 Mbps)	0.12
10069-CAE	IEEE 802.11a/h WiFi 5 GHz (OFDM, 54 Mbps)	-3.15
10591-AAD	IEEE 802.11n (HT Mixed, 20MHz, MCS0, 90pc duty cycle)	-5.59
10599-AAD	IEEE 802.11n (HT Mixed, 40MHz, MCS0, 90pc duty cycle)	-5.59
10607-AAD	IEEE 802.11ac WiFi (20MHz, MCS0, 90pc duty cycle)	-5.6
10616-AAD	IEEE 802.11ac WiFi (40MHz, MCS0, 90pc duty cycle)	-5.57
10626-AAD	IEEE 802.11ac WiFi (80MHz, MCS0, 90pc duty cycle)	-5.64

The MIF measurement uncertainty is estimated as follows, for modulation frequencies from slotted waveforms with fundamental frequency and at least 2 harmonics within 10 kHz:

- 0.2 dB for MIF -7 to +5 dB,
- 0.5 dB for MIF -13 to +11 dB
- 1 dB for MIF > -20 dB

Test sample information	S/N R3CX807W47E	Notes RF Audio Interference Level Test

10.1. Air Interfaces and Operating Mode

Air Interface	Bands (MHz)	Type	Evaluation	Simultaneous Transmitter	Name of Voice Service
GSM	850	VO	RF _{AIL}	Wi-Fi and BT	CMRS
	1900				
	GPRS/EDGE	VD	No	Wi-Fi and BT	Google Meet
W-CDMA (UMTS)	850 (V)	VO	RF _{AIPL}	Wi-Fi and BT	CMRS
	1750 (IV)				
	1900 (II)				
	HSPA	VD	No	Wi-Fi and BT	Google Meet
LTE - FDD	680 (B71)	VD	RF _{AIPL}	NR, Wi-Fi and BT	VoLTE Google Meet
	700 (B12)				
	780 (B13)				
	790 (B14)				
	850 (B5/26)				
	1700 (B4/66)				
	1900 (B2/25)				
	2300 (B30)				
	2600 (B7)				
LTE - TDD	2600 (B38/41)	VD	RF _{AIPL} , RF _{AIL}	NR, Wi-Fi and BT	VoLTE Google Meet
	3600 (B48)				
NR - FDD	680 (n71)	VD	RF _{AIPL}	LTE, Wi-Fi and BT	VoNR Google Meet
	850 (n5)				
	1700 (n66)				
	1700 (n70)				
	1900 (n2/25)				
	2300 (n30)				
NR - TDD	2600 (n41)	VD	RF _{AIPL} , RF _{AIL}	LTE, Wi-Fi and BT	VoNR Google Meet
	3600 (n48)				
	3500 (n77/78 DoD)				
	3700 (n77/89)				
Wi-Fi	2450	VD	RF _{AIPL}	WWAN	VoWiFi Google Meet
	5200 (U-NII-1)			WWAN and BT	
	5300 (U-NII-2A)				
	5500 (U-NII-2C)				
	5800 (U-NII-3)				
BT	2450	DT	N/A	WWAN and U-NII	N/A

Type

Note:

VO: Legacy Cellular Voice Service

DT: Digital Transport only (no voice)

VD: IP Voice Service over Digital Transport

CMRS: Commercial Mobile Radio Service

BT: Bluetooth

Note(s):

All tests were performed with the transmit power set to the maximum power for held-to-head conditions (RCV active). For air interfaces with a Time Averaged SAR (TAS) algorithm P_{max} is considered the maximum power.

11. RF Near-field Test Procedure (RF Audio Interference Level, RF_{AIL})

WD near-field RF emission scan flowchart Per ANSI-63.19-2019

The following steps, included in the depiction of flowchart above, shall be followed when using this test procedure:

- a) Confirm proper operation of the field probe, probe measurement system, spectral and temporal weighting filters, and the positioning system.
- b) Position the WD in its intended test position.

- c) Set the WD to transmit a fixed and repeatable combination of signal power and modulation characteristic that is representative of the worst case (highest interference potential) encountered in normal use. Transiently occurring start-up, changeover, or termination conditions, or other operation likely to occur less than 1% of the time during normal operation, may be excluded from consideration.
- d) The measurement area shall be centered on the acoustic output or the T-Coil mode measurement reference point, as appropriate. Locate the field probe at the initial test position in the 50 mm by 50 mm measurement area, which is contained in the measurement plane. If the field alignment method is used, align the probe for maximum field reception.
- e) Record the reading at the output of the measurement system.
- f) Scan the entire 50 mm by 50 mm measurement area in equally spaced step sizes and record the reading at each measurement point. The step size shall meet the specification for step size $\leq 10\text{mm}$.
- g) Calculate the average of the measurements taken in Step f).
- h) Convert the average value found in Step g) to RF audio interference level, in volts per meter, by taking the square root of the reading and then dividing it by the measurement system transfer function. Convert the result to dB(V/m) by taking the base-10 logarithm and multiplying it by 20. Expressed as a formula:

$$\text{RF audio interference level in dB(V/M)} = 20 \times \log(R_{\text{avg}}^{1/2} / \text{TF}) \quad (3)$$

where, R_{avg} is the average reading

- i) Compare this RF audio interference level to the limits in Sec.5 and record the result.

The picture below illustrates the references and reference plane that shall be used in the WD RF emissions measurement.

The measurement area is 50.0 mm by 50.0 mm and centered on the audio frequency output transducer of the WD (speaker or T-Coil signal) and the area in a reference plane, which is defined as the planar area tangent to the highest point in the area of the phone that normally rests against the user's ear. It is parallel to the centerline of the receiver area of the phone and is defined by the points of the receiver-end of the WD handset, which, in normal handset use, rest against the ear.

The measurement plane is parallel to, and 15.0 mm in front of, the reference plane.

WD reference and plane for RF Near-field measurements

12. RF Near-field Test Results (RF Audio Interference Level, RF_{AIL})

MIF values were not tested by a probe or as specified in the standards but are based on analysis provided by SPEAG for the following User Identifiers and air interfaces.

The data included in this report are for the worst case operating modes. Refer to Appendix D and G for the MIF values that represent the worst case operation modes.

Mode / Band	Antenna	Ch. No.	Freq. (MHz)	Results* (dB V/m)	Results plus 0.2dB uncertainty (dB V/m)	RF _{AIL} Limit (dB V/m)	Margin (dB)	RF _{AIL} Pass/Fail	Plot No.
GSM 850	Ant.A	128	824.2	33.84	34.04	39.00	4.96	Pass	1
		190	836.6	35.13	35.33	39.00	3.67	Pass	2
		251	848.6	34.36	34.56	39.00	4.44	Pass	3
GSM 1900	Ant.A	512	1850.2	25.23	25.43	36.00	10.57	Pass	4
		661	1880	25.44	25.64	36.00	10.36	Pass	5
		810	1909.8	26.03	26.23	36.00	9.77	Pass	6
LTE-TDD Band 41 PC2 20MHz 16QAM RB1/0	Ant.A	39750	2506	21.27	21.47	35.00	13.53	Pass	10
