## 2. Device Category and RF Exposure Limit

Based on 47 CFR 2.1091, this device belongs to mobile device category with General Population/Uncontrolled exposure.

### Mobile Devices:

### 47 CFR 2.1091(b)

For purposes of this section, a mobile device is defined as a transmitting device designed to be used in other than fixed locations and to generally be used in such a way that a separation distance of at least 20 centimeters is normally maintained between the transmitter's radiating structure(s) and the body of the user or nearby persons. In this context, the term "fixed location" means that the device is physically secured at one location and is not able to be easily moved to another location. Transmitting devices designed to be used by consumers or workers that can be easily re-located, such as wireless devices associated with a personal computer, are considered to be mobile devices if they meet the 20 centimeter separation requirement.

### General Population/Uncontrolled Exposure:

The general population/uncontrolled exposure limits are applicable to situations in which the general public may be exposed or in which persons who are exposed as a consequence of their employment may not be made fully aware of the potential for exposure or cannot exercise control over their exposure. Members of the general public would come under this category when exposure is not employment-related; for example, in the case of a wireless transmitter that exposes persons in its vicinity. Warning labels placed on low-power consumer devices such as cellular telephones are not considered sufficient to allow the device to be considered under the occupational/controlled category, and the general population/uncontrolled exposure limits apply to these devices.

### 3. Maximum Average Power Summary

Channel	Frequency	Max. Average Power	Tune-up Limit
	(MHz)	(dBm)	(dBm)
65	915	15.90	16.50

**Note 1:** According to KDB 447498, MPE assessment is based on source-based time-averaged maximum conducted output power of the RF channel requiring assessment, adjusted for tune-up tolerance, and the minimum test separation distance required for the exposure conditions. **Note 2:** The maximum output power refers to report (Report No.: SZ24040151W01).

# **4. RF Exposure Assessment**

### > Standalone Transmission Assessment:

Frequency	Tune-up	Antenna	E.I.R.P.	Power Density	Limit for MPE
(MHz)	Power(dBm)	Gain(dBi)	(mW)	(mW/cm²)	(mW/cm <sup>2</sup> )
915	16.50	2.22	74.47	0.015	0.610

Note:

1. According to KDB 447498, MPE assessment is based on source-based time-averaged maximum conducted output power of the RF channel requiring assessment, adjusted for tune-up tolerance, and the minimum test separation distance required for the exposure conditions.

2. MPE calculate method

### $S = PG/4\pi R^2$

Where: S= Power density (in appropriate units, e.g. mW/cm<sup>2</sup>)

P = Time-average maximum tune-up power (in appropriate units, e.g. dBm)

G = numeric gain of the antenna (in appropriate units, e.g. dBi)

R = Separation distance to the centre of radiation of the antenna (20cm)

### > Simultaneous Transmission Assessment:

This device only incorporates one transmitter, therefore simultaneous assessment is not required.

### Conclusion:

According to 47 CFR §2.1091, this device complies with human exposure basic restrictions.
