### 5.3 Test environment and test mode

| <b>Operating Environment:</b>  |   |
|--|---|
| Temperature:   | 24.0 °C   |
| Humidity:  | 54 % RH   |
| Atmospheric Pressure:  | 1010 mbar   |
| <b>Test mode:</b>  |   |
| Transmitting mode  | Keep the EUT in continuous transmitting with modulation |
| The sample was placed 0.8m (below 1GHz)/1.5m (above 1GHz) above the ground plane of 3m chamber. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating the turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages. |   |
| We have verified the construction and function in typical operation. All the test modes were carried out with the EUT in transmitting operation, which was shown in this test report and defined as follows:   |   |
| <b>Per-scan all kind of data rate, the follow list were the worst case.</b>  |   |
| Mode   | Data rate   |
| 802.11b  | 1Mbps   |
| 802.11g  | 6Mbps   |
| 802.11n(H20)   | 6.5Mbps   |
| 802.11n(H40)   | 13.5Mbps  |

### 5.4 Description of Support Units

The EUT has been tested as an independent unit.

### 6.1 Antenna requirement

|   |  |
|---|--|
| Standard requirement:   | FCC Part 15 C Section 15.203 /247(b)   |
| 15.203 requirement:<br>An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited. | 15.247(b) (4) requirement:<br>(4) The conducted output power limit specified in paragraph (b) of this section is based on the use of antennas with directional gains that do not exceed 6 dBi. Except as shown in paragraph (c) of this section, if transmitting antennas of directional gain greater than 6 dBi are used, the conducted output power from the intentional radiator shall be reduced below the stated values in paragraphs (b)(1), (b)(2), and (b)(3) of this section, as appropriate, by the amount in dB that the directional gain of the antenna exceeds 6 dBi. |
| E.U.T Antenna:  | The WiFi antenna is an Internal antenna which cannot replace by end-user, the best case gain of the antenna is 1.2 dBi.  |

## 6.7 Spurious Emission

### 6.7.1 Conducted Emission Method

|                   |  |
|-------------------|--|
| Test Requirement: | FCC Part 15 C Section 15.247 (d)   |
| Test Method:      | ANSI C63.10:2013 and KDB 558074  |
| Limit:            | In any 100 kHz bandwidth outside the frequency band in which the spread spectrum intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement. If the transmitter complies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph(b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. |
