According to 447498 D01 General RF Exposure Guidance v05 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances \leq 50 mm are determined by: [(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] • [$\sqrt{f(GHz)}$] \leq 3.0 for 1-g SAR and \leq 7.5 for 10-g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest $\mathtt{m} \mathtt{W}$ and $\mathtt{m} \mathtt{m}$ before calculation

The result is rounded to one decimal place for comparison

```
eirp = pt x gt = (EXd)^2/30
where:
pt = transmitter output power in watts,
gt = numeric gain of the transmitting antenna (unitless),
E = electric field strength in V/m, --- 10^{((dBuV/m)/20)}/10^6
d = measurement distance in meters (m)---3m
Sopt = (EXd)^2/30 x gt
```

Ant gain=0dBi ;so Ant numeric gain=1

Field strength =80.87dBuV/m @3m So Pt={ $[10^{(80.87/20)}/10^6 \text{ x3}]^2/30x1$ }x1000 mW = 0.037mW

So $(0.037 \text{mW}/5 \text{mm}) \times \sqrt{0.315 \text{GHz}} = 0.004 < 3$

Then SAR evaluation is not required
