## RF Exposure evaluation

According to 447498 D01 General RF Exposure Guidance v05 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by: [(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]  $\cdot [\sqrt{f(GHz)}] \leq 3.0$  for 1-g SAR and  $\leq$  7.5 for 10-g extremity SAR, where

f(GHz) is the RF channel transmit frequency in GHz

Power and distance are rounded to the nearest  $\mathtt{m} \mathtt{W}$  and  $\mathtt{m} \mathtt{m}$  before calculation

The result is rounded to one decimal place for comparison

pt=-0.193dBm =0.957Mw at 2480MHz So (0.957mW/5mm)x  $\sqrt{2.480GHz}$  = 0.301 <3

Then SAR evaluation is not required
