VTech Telecommunications Ltd. Intertek Report No: 23070607HKG-001

# **TEST REPORT**

### EXHIBIT 1 GENERAL DESCRIPTION

1.1 Product Description

The RM7766HD BU (35-400364BUC) is a Video Baby Monitor - Baby Unit.

The Equipment Under Test (EUT) operates at frequency range of 2412 MHz to 2462 MHz with 11 channels.

For IEEE 802.11b mode, it operates at frequency range of 2412.000 MHz to 2462.000 MHz with 11 channels. It transmits via Direct-sequence spread spectrum (DSSS) modulation. Maximum bit rate can be up to 11Mbps.

For IEEE 802.11g mode, it operates at frequency range of 2412.000 MHz to 2462.000 MHz with 11 channels. It transmits via Orthogonal Frequency Division Multiplexing (OFDM) modulation. Maximum bit rate can be up to 54Mbps.

For IEEE 802.11n (with 20 MHz bandwidth) mode, it operates at frequency range of 2412.000 MHz to 2462.000 MHz with 11 channels. It transmits via Orthogonal Frequency Division Multiplexing (OFDM) modulation. Maximum bit rate can support up to 65Mbps.

The EUT is powered by 100-240VAC 50/60Hz 0.15A adaptor.

The antenna(s) used in the EUT is integral, and the test sample is a prototype. Peak Antenna Gain: OdBi

For FCC, the Model(s): RM7766-2HD BU, RM7766-abHD BU, RM7866HD BU, RM7866-2HD BU are the same as the Model: RM7766HD BU in electronics/electrical designs including software & firmware, PCB layout and construction design/physical design/enclosure. The only differences between these models are model number and color to be sold for marketing purpose as declared by client.

The circuit description is saved with filename: descri.pdf.

#### 1.2 Test Methodology

Both AC power line-conducted and radiated emission measurements were performed according to the procedures in ANSI C63.10 (2013). Preliminary radiated scans and all radiated measurements were performed in radiated emission test sites. All Radiated tests were performed at an antenna to EUT distance of 3 meters, unless stated otherwise in the "Justification Section" of this Application. Antenna port conducted measurements were performed according to ANSI C63.10 (2013) and KDB Publication No. 558074 D01 v05r02 (April 02, 2019) All other measurements were made in accordance with the procedures in 47 CFR Part 2 and RSS-Gen Issue 5 Amendment 2, February 2021.

#### 1.3 Test Facility

The radiated emission test site and antenna port conducted measurement facility used to collect the radiated data and conductive data are at Workshop No. 3, G/F., World-Wide Industrial Centre, 43-47 Shan Mei Street, Fo Tan, Sha Tin, N.T., Hong Kong SAR, China. This test facility and site measurement data have been fully placed on file with the FCC and Industry Canada No.: 2042H, CABID is "HKAP01".

#### 1.4 Related Submittal(s) Grants

This is a single application for certification of a transceiver (WiFi Portion).

### EXHIBIT 2 SYSTEM TEST CONFIGURATION

#### 2.1 Justification

For radiated emissions testing, the equipment under test (EUT) was setup to transmit / receive continuously to simplify the measurement methodology. Care was taken to ensure proper power supply voltages during testing. During testing, all cables (if any) were manipulated to produce worst case emissions.

The EUT was powered by 120VAC during test.

For the measurements, the EUT was attached to a plastic stand if necessary and placed on the wooden turntable at 0.8m height from the ground plane for emission testing at or below 1GHz and 1.5m for emission measurements above 1GHz. If the baby unit attached to peripherals, they were connected and operational (as typical as possible). The parent unit was remotely located as far from the antenna and the baby as possible to ensure full power transmission from the parent unit. Else, the base was wired to transmit full power with modulation.

The signal was maximized through rotation and placement in the three orthogonal axes. The antenna height and polarization were varied during the search for maximum signal level. The antenna height was varied from 1 to 4 meters. Radiated emissions were taken at three meters unless the signal level was too low for measurement at that distance. If necessary, a pre-amplifier was used and/or the test was conducted at a closer distance.

For any intentional radiator powered by AC power line, measurements of the radiated signal level of the fundamental frequency component of the emission was performed with the supply voltage varied between 85% and 115% of the nominal rated supply voltage.

Radiated emission measurement for transmitter were performed from the lowest radio frequency signal generated in the device which is greater than 9 kHz to the tenth harmonic of the highest fundamental frequency or to 40 GHz, whichever is lower.

Emission that are directly caused by digital circuits in the transmit path and transmitter portion were measured, and the limit are according to FCC Part 15 Section 15.209 / RSS-247 2.5. Digital circuitries used to control additional functions other than the operation of the transmitter are subject to FCC Part 15 Section 15.109 / RSS-247 Section 5.5 Limits.

### 2.1 Justification (Cont'd)

Detector function for radiated emissions was in peak mode. Average readings, when required, were taken by measuring the duty cycle of the equipment under test and subtracting the corresponding amount in dB from the measured peak readings. A detailed description for the calculation of the average factor can be found in section 4.8.3.

Determination of pulse desensitization was made according to *Hewlett Packard Application Note 150-2, Spectrum Analysis… Pulsed RF.* The effective period (Teff) was referred to Exhibit 4.8.3. With the resolution bandwidth 1MHz and spectrum analyzer IF bandwidth 3dB, the pulse desensitization factor was 0dB.

For AC power line-conducted emission test, the EUT along with its peripherals were placed on a 1.0m(W)x1.5m(L) and 0.8m in height wooden table and the EUT was adjusted to maintain a 0.4 meter space from a vertical reference plane. The EUT was connected to power mains through a line impedance stabilization network (LISN), which provided 500hm coupling impedance for measuring instrument. The LISN housing, measuring instrument case, reference ground plane, and vertical ground plane were bounded together. The excess power cable between the EUT and the LISN was bundled.

All connecting cables of EUT and peripherals were manipulated to find the maximum emission.

All relevant operation modes have been tested, and the worst-case data is included in this report.

All data rates were tested under normal mode of WiFi. Only the worst-case data is shown in the report for DSSS and OFDM.

#### 2.2 EUT Exercising Software

The EUT exercise program (Tera Terms Version 4.106) used during radiated and conducted testing was designed to exercise the various system components in a manner similar to a typical use.

VTech Telecommunications Ltd. Intertek Report No: 23070607HKG-001

# **TEST REPORT**

### 2.3 Details of EUT and Description of Accessories

Details of EUT:

An AC/DC Adaptor (provided with the unit) was used to power the device. Their descriptions are listed below.

(1) An AC adaptor (Model: VT05EUS05100; Brand Name: VTPL; Input: 100-240VAC 50/60Hz 0.15A; Output: 5.0VDC 1.0A 5.0W) (Provided by Applicant)

Description of Accessories:

- (1) Parent Unit (FCC ID: EW780-2632-01B) (Provided by Applicant)
- 2.4 Measurement Uncertainty

Decision Rule for compliance: For FCC/IC standard, the measured value must be within the limits of applicable standard without accounting for the measurement uncertainty. For EN/IEC/HKTA/HKTC standard, conformity rules will be used as per standard directly excepted EN/IEC 61000-3-2, EN/IEC 61000-3-3, HKTA1004, HKCA1008, HKTA1019, HKTA1020, HKTA1041 and HKTA1044. For these excepted or not mentioned standards, Cl 4.2.2 of ILAC-G8:09/2019 decision rules will be reference and guard band will be equal to our measurement uncertainty with 95% confidence level (k=2). In case, the measured value is within guard band region, undetermined decision will be used.

Uncertainty and Compliance - Unless the standard specifically states that measured values are to be extended by the measurement uncertainty in determining compliance, all compliance determinations are based on the actual measured value.

VTech Telecommunications Ltd. Intertek Report No: 23070607HKG-001

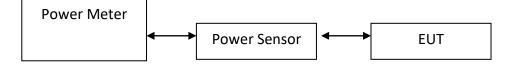

# **TEST REPORT**

## EXHIBIT 3 TEST RESULTS

3.1 Maximum Conducted (Peak) Output Power at Antenna Terminals

**RF** Conduct Measurement Test Setup

The figure below shows the test setup, which is utilized to make these measurements.

The antenna port of the EUT was connected to the input of a spectrum analyzer.

The antenna power of the EUT was connected to the input of a power meter. Power was read directly and cable loss correction was added to the reading to the obtain power at the EUT antenna terminals. The measurement procedure 8.3.2.3 was used.

The EUT should be configured to transmit continuously (at a minimum duty cycle of 98%) at full power over the measurement duration. The measurement procedure AVG1 was used.

IEEE 802.11b (DSSS, 1 Mbps) Peak Antenna Gain = 0 dBi

| Frequency       | (MHz) | Output in dBm | Output in mW |
|-----------------|-------|---------------|--------------|
| Low Channel:    | 2412  | 12.5          | 17.8         |
| Middle Channel: | 2437  | 12.7          | 18.6         |
| High Channel:   | 2462  | 13.3          | 21.4         |

#### IEEE 802.11g (OFDM, 6 Mbps) Peak Antenna Gain = 0 dBi

| Frequency       | (MHz) | Output in dBm | Output in mW |
|-----------------|-------|---------------|--------------|
| Low Channel:    | 2412  | 10.4          | 11.0         |
| Middle Channel: | 2437  | 10.7          | 11.7         |
| High Channel:   | 2462  | 11.7          | 14.8         |

#### IEEE 802.11n (20MHz) (OFDM, MCS0) Peak Antenna Gain = 0 dBi

| Frequency       | (MHz) | Output in dBm | Output in mW |
|-----------------|-------|---------------|--------------|
| Low Channel:    | 2412  | 9.4           | 8.7          |
| Middle Channel: | 2437  | 9.9           | 9.8          |
| High Channel:   | 2462  | 10.8          | 12.0         |

3.1 Maximum Conducted (Peak) Output Power at Antenna Terminals (Cont'd)

Cable loss: 0.5 dB External Attenuation: 0 dB

Cable loss, external attenuation:

included in OFFSET function added to SA raw reading

IEEE 802.11b (DSSS, 1 Mbps) Max. Conducted (Peak) Output Level = 13.3 dBm

IEEE 802.11g (OFDM, 6 Mbps) Max. Conducted (Peak) Output Level = 11.7 dBm

IEEE 802.11n (20MHz) (OFDM, MCS0) Max. Conducted (Peak) Output Level = 10.8 dBm

Limits:

1W (30dBm) for antennas with gains of 6dBi or less.

The plots of Conducted (Peak) Output Power at Antenna Terminals are saved with filename: test data.pdf

### 3.2 Minimum 6dB RF Bandwidth

The antenna port of the EUT was connected to the input of a spectrum analyzer. The EBW measurement procedure was used. A PEAK output reading was taken, a DISPLAY line was drawn 6dB lower than PEAK level. The 6dB bandwidth was determined from where the channel output spectrum intersected the display line.

#### IEEE 802.11b (DSSS, 1 Mbps)

| Frequency (MHz) |      | 6dB Bandwidth (MHz) |
|-----------------|------|---------------------|
| Low Channel:    | 2412 | 8.8                 |
| Middle Channel: | 2437 | 9.3                 |
| High Channel:   | 2462 | 9.3                 |

#### IEEE 802.11g (OFDM, 6 Mbps)

| Frequency (MHz) |      | 6dB Bandwidth (MHz) |
|-----------------|------|---------------------|
| Low Channel:    | 2412 | 16.7                |
| Middle Channel: | 2437 | 16.7                |
| High Channel:   | 2462 | 16.7                |

#### IEEE 802.11n (20MHz) (OFDM, MCSO)

| Frequency (MHz) |      | 6dB Bandwidth (MHz) |
|-----------------|------|---------------------|
| Low Channel:    | 2412 | 16.7                |
| Middle Channel: | 2437 | 16.7                |
| High Channel:   | 2462 | 16.7                |

Limits:

6dB bandwidth shall be at least 500kHz.

The plots of 6dB RF Bandwidth are saved with filename: test data.pdf

### 3.3 Minimum Power Spectral Density

Antenna output of the EUT was coupled directly to spectrum analyzer. The measurement procedure 10.2 PKPSD was used. If an external attenuator and/or cable was used, these losses are compensated for using the OFFSET function of the analyser.

#### IEEE 802.11b (DSSS, 1 Mbps)

| Frequency (MHz) |      | PSD in 100kHz (dBm) |
|-----------------|------|---------------------|
| Low Channel:    | 2412 | 2.497               |
| Middle Channel: | 2437 | 2.572               |
| High Channel:   | 2462 | 3.233               |

#### IEEE 802.11g (OFDM, 6 Mbps)

| Frequency (MHz) |      | PSD in 100kHz (dBm) |

### 3.4 Out of Band Conducted Emissions

For IEEE 802.11b/g/n20MHz, the maximum conducted (peak) output power was used to demonstrate compliance as described in 9.1. Then the display line (in red) shown in the following plots denotes the limit at 20dB below maximum measured in-band peak PSD level in 100 KHz bandwidth for IEEE 802.11b/g/n20MHz.

The measurement procedures under sections 11 of KDB558074 D01 v05r02 (April 2, 2019) were used.

Furthermore, delta measurement technique for measuring bandedge emissions was incorporated in the test of the edge at 2483.5MHz.

Limits:

All spurious emission and up to the tenth harmonic was measured and they were found to be at least 20dB below the maximum measured in-band peak PSD level for IEEE 802.11b/g/n20MHz.

The plots of Out of Band Conducted Emissions are saved with filename: test data.pdf

### 3.5 Field Strength Calculation

The field strength is calculated by adding the reading on the Spectrum Analyzer to the factors associated with preamplifiers (if any), antennas, cables, pulse desensitization and average factors (when specified limit is in average and measurements are made with peak detectors). A sample calculation is included below.

FS = RA + AF + CF - AG + PD + AV

| Where | FS | = | Field Strength in dBμV/m                                 |
|-------|----|---|--|
|       | RA | = | Receiver Amplitude (including preamplifier) in $dB\mu V$ |
|       | CF | = | Cable Attenuation Factor in dB                           |
|       | AF | = | Antenna Factor in dB                                     |
|       | AG | = | Amplifier Gain in dB                                     |
|       | PD | = | Pulse Desensitization in dB                              |
|       | AV | = | Average Factor in -dB                                    |

In the radiated emission table which follows, the reading shown on the data table may reflects the preamplifier gain. An example of the calculations, where the reading does not reflect the preamplifier gain, follows:

FS = RA + AF + CF - AG + PD + AV

Example:

Assume a receiver reading of 62.0 dB $\mu$ V is obtained. The antenna factor of 7.4 dB and cable factor of 1.6 dB is added. The amplifier gain of 29.0 dB is subtracted. The pulse desensitization factor of the spectrum analyzer is 0.0 dB, and the resultant average factor is -10.0 dB. The net field strength for comparison to the appropriate emission limit is 32.0 dB $\mu$ V/m. This value in dB $\mu$ V/m is converted to its corresponding level in  $\mu$ V/m.

| RA | = | 62.0 dBμV  |
|----|---|--|
| AF | = | 7.4 dB   |
| CF | = | 1.6 dB   |
| AG | = | 29.0 dB  |
| PD | = | 0.0 dB   |
| AV | = | -10.0 dB   |
| FS | = | 62.0 + 7.4 + 1.6 - 29.0 + 0.0 + -10.0) = 32.0 dBµV/m |

Level in  $\mu$ V/m = Common Antilogarithm [(32.0 dB $\mu$ V/m)/20] = 39.8  $\mu$ V/m

3.6 Transmitter Radiated Emissions in Restricted Bands and Spurious Emissions

Data is included of the worst-case configuration (the configuration which resulted in the highest emission levels). A sample calculation, configuration photographs and data tables of the emissions are included.

The data on the following pages list the significant emission frequencies, the limit and the margin of compliance.

3.6.1 Radiated Emission Configuration Photograph

Worst Case Restricted Band Radiated Emission at 14472 MHz.

The worst case radiated emission configuration photographs are saved with filename: Setup Photos.pdf

3.6.2 Radiated Emission Data

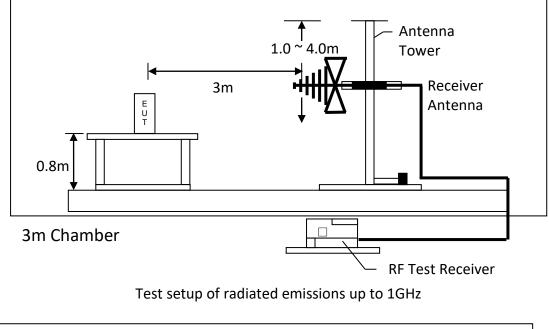

The data in tables 1-10 list the significant emission frequencies, the limit and the margin of compliance.

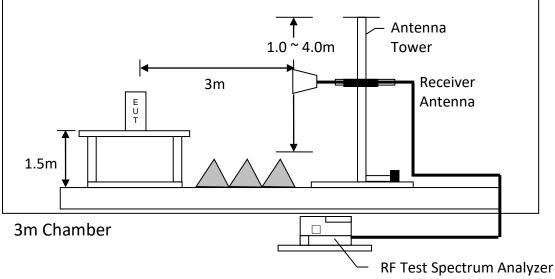

Judgement – Passed by 0.2 dB margin

### 3.6.3 Radiated Emission Test Setup

The figure below shows the test setup, which is utilized to make these measurements.

Test setup of radiated emissions above 1GHz

- 2. Average detector is used for the average data of emission measurement.
- 3. All measurements were made at 3 meters.
- 4. Negative value in the margin column shows emission below limit.
- 5. Horn antenna is used for the emission over 1000MHz.
- 6. Emissions within the restricted band meets the requirement of FCC Part 15 Section 15.205 / RSS-Gen Section 8.10.
- 7. Measurement Uncertainty is ±5.3dB at a level of confidence of 95%.
- 8. For the measurement of radiated emission, summation method was used which numerical integrating (in terms of linear power) over the transmitter occupied bandwidth.
- 9. For the linear power measurement, data in 1MHz spacing was collected by spectrum analyzer with 1MHz resolution bandwidth.

Notes: 1. Quasi-Peak detector is used for the emission measurement.

2. All measurements were made at 3 meters.

3. Negative value in the margin column shows emission below limit.

4. Emissions within the restricted band meets the requirement of FCC Part 15 Section 15.205 / RSS-Gen Section 8.10.

5. Measurement Uncertainty is ±5.3dB at a level of confidence of 95%.

VTech Telecommunications Ltd. Intertek Report No: 23070607HKG-001

# **TEST REPORT**

3.7 Transmitter Duty Cycle Calculation

Not Applicable – No average factor is required

- 3.8 AC Power Line Conducted Emission
- Not Applicable EUT is only powered by battery for operation.

EUT connects to AC power line. Emission Data is listed in following pages.

- Base Unit connects to AC power line and has transmission. Handset connects to AC power line but has no transmission. Emission Data of Base Unit is listed in following pages.
- 3.8.1 AC Power Line Conducted Emission Configuration Photograph

Worst Case Line-Conducted Configuration at 0.366 MHz.

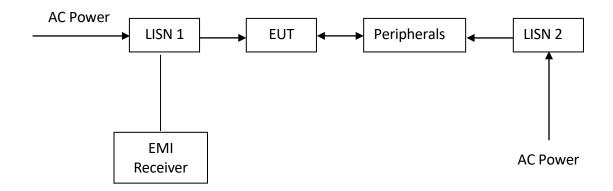

The worst-case line conducted configuration photographs are attached in the Appendix and saved with filename: Setup Photos.pdf.

3.8.2 AC Power Line Conducted Emission Data

The plot(s) and data in the following pages list the significant emission frequencies, the limit and the margin of compliance.

Passed by 16.4 dB margin

3.8.3 Conducted Emission Test Setup

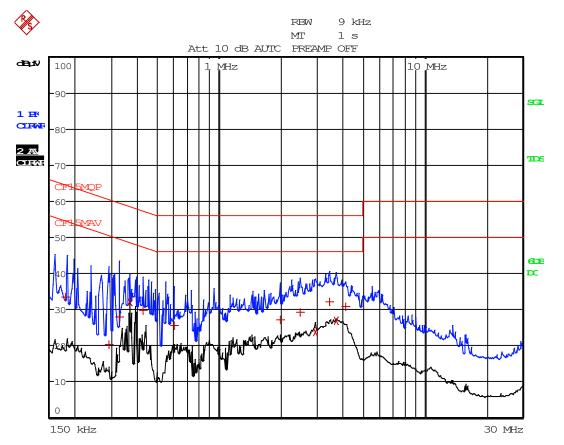

The EUT along with its peripherals were placed on a  $1.0m(W) \times 1.5m(L)$  and 0.8m in height wooden table and the EUT was adjusted to maintain a 0.4 meter space from a vertical reference plane. The EUT was connected to power mains through a line impedance stabilization network (LISN), which provided 50 ohm coupling impedance for measuring instrument and the chassis ground was bounded to the horizontal ground plane of shielded room. The excess power cable between the EUT and the LISN was bundled.

All connecting cables of EUT and peripherals were moved to find the maximum emission.

## AC POWER LINE CONDUCTED EMISSION

### Worst Case: WiFi Operating

VTech Telecommunications Ltd. Intertek Report No: 23070607HKG-001
