Manufacturer: Shanghai Huace Navigation Technology LTD.
Building C,599 Gaojing Road,Qingpu District,Shanghai

Product Name: GNSS receiver

Brand Name:

Model Name: i80 WXYZ

Model Description: See Part1.1 Note.

FCC ID: SY4-A01004

Serial Number: N/A

EUT Voltage: MIN: 8V, NOR:12V, MAX: 36V

Date of Receipt: 03-12-2015

Test Standard: ANSI/TIA-603-D-2010; FCC CFR Title 47 Part 2
FCC CFR Title 47 Part 90 Subpart I;
ANSI C63.4: 2009

Test Result: PASS

Date of Test: 06-08-2015~07-30-2015

1. GENERAL INFORMATION

1.1 EUT DESCRIPTION

Product Name:	GNSS receiver
Model Name:	i80 WXYZ
Hardware Version:	V1.3
Software Version:	V1.1.8
RF Exposure Environment:	Uncontrolled
Radio	
Operating Frequency band:	403MHz to 406MHz 406.1MHz to 473MHz
Channel Separation	12.5KHz, 25.0 KHz
Type of modulation:	4FSK, GMSK
Antenna Type:	Detachable
Antenna Peak Gain:	3.0dBi
Component	
AC Adapter	Input: AC 100-240V 50/60Hz
	Output: DC 12V 2A

Note: Model i80 WXYZ, W is variable, it indicated A-Z or 0-9 or blank , X is variable, it indicated A-Z or 0-9 or blank , Y is variable, it indicated A-Z, 0-9 or blank. Z is variable, it indicated A-Z, 0-9 or blank. due to sales purpose in different countries or regions. The internal PCB design are no difference , but only distinct in colours and model names. This test model name is i80.

1.2 TEST MODE

Unilab has verified the construction and function in typical operation. All the test modes were carried out with the EUT in normal operation, which was shown in this test report and defined as:

Test Mode
Mode 1: 4FSK, 12.5 KHz bandwidth
Mode 2: 4FSK, 25 KHz bandwidth
Mode 3: GMSK, 12.5 KHz bandwidth
Mode 4: GMSK, 25 KHz bandwidth

Note:

1. Regards to the frequency band operation: the lowest, middle and highest frequency of channel were selected to perform the test, then shown on this report.
2. For the radiated emission test, every axis (X, Y, Z) was verified, and show the worst result on this report.

2. TEST METHODOLOGY

The tests documented in this report were performed in accordance with ANSI C63.4: 2009, ANSI/TIA-603-D-2010 and FCC CFR 47 2.1046, 2.1047, 2.1049, 2.1051, 2.1053, 2.1055, 2.1057.

2.1 EUT CONFIGURATION

The EUT configuration for testing is installed on RF field strength measurement to meet the Commissions requirement and operating in a manner that intends to maximize its emission characteristics in a continuous normal application

2.2 EUT EXERCISE

The EUT has been programmed to continuously transmit or receive during testing. The used peripherals as well as the configuration fulfill the requirements of ANSI C63.4:2009.

2.3 GENERAL TEST PROCEDURES

Conducted Emissions

The EUT is placed on the turntable, which is 0.8 m above ground plane. According to the requirements in Section 13.1.4.1 of ANSI C63.4: 2009 Conducted emissions from the EUT measured in the frequency range between 0.15 MHz and 30MHz using CISPR Quasi-peak and average detector modes.

Radiated Emissions

The EUT is placed on a turn table, which is 0.8 m above ground plane. The turntable shall rotate 360 degrees to determine the position of maximum emission level. EUT is set 3m away from the receiving antenna, which varied from 1m to 4m to find out the highest emission. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical. In order to find out the maximum emissions, exploratory radiated emission measurements were made according to the requirements in Section 13.1.4.1 of ANSI C63.4: 2009.

2.4 DESCRIPTION OF TEST MODES

The EUT has been tested under operating condition.

Three channels (403MHz, 450MHz and 473MHz) are chose for testing at each channel separation (12.5 KHz, 25.0 KHz), and each modulation (4FSK, GMSK).

3. TECHNIACL SUMMARY

3.1 SUMMARY OF STANDARDS AND TEST RESULTS

The EUT have been tested according to the applicable standards as referenced below:

Test Item	FCC	Result
RF Power Output	§2.1046 (a), §90.205	Pass
Transmitter Spurious Conducted Emissions	§2.1051, §90.210	Pass
Field Strength of Spurious Radiation	§2.1053(a), §90.210	Pass
Emission Masks	§90.210	Pass
Occupied Bandwidth	§2.1049(c)(1), §90.209	Pass
Frequency Stability vs. Temperature and Voltage	§2.1055, §90.213	Pass
Transient Frequency Behavior	§90.214	Pass
Modulation Characteristics	§2.1047 (a)(b)	NA(note)

Note: The EUT is digital; no audio function and audio filtering present therefore testing not required.

3.2 TEST UNCERTAINTY

Where relevant, the following test uncertainty levels have been estimated for tests performed on the EUT as specified in CISPR 16-4-2. This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

Test item	Value (dB)
Conducted disturbance	3.4
Radiated disturbance	4.2

3.3 TEST EQUIPMENT LIST

Loop Antenna	Schwarzbeck	FMZB1519	1519-020	3 years	03/25/2016

3.4 TEST FACILITY

All test facilities used to collect the test data are located at No.1350, Lianxi Rd. Pudong New District, Shanghai, China. The site and apparatus are constructed in conformance with the requirements of ANSI C63.4: 2009, CISPR 16-1-1 and other equivalent standards. The laboratory is compliance with the requirements of the ISO/IEC/E 17025.

3.5 TEST SETUP CONFIGURATION

The information contained within this report is intended to show verification of compliance of the EUT to the requirements of CFR 47 FCC Part 90.

Unilab has verified the construction and function in typical operation. All the test modes were carried out with the EUT in normal operation, which was shown in this test report.

4. TRANSMITTER OUTPUT POWER

4.1 TEST SETUP LAYOUT

Transmitter Radiated Power

Transmitter Conducted Output Power

4.2 TEST PROCEDURE

Transmitter Radiated Out Power

1. The EUT was placed on the top of the turntable in semi-anechoic chamber.
2. The test shall be made in the transmitting mode. Antenna tower was scan (from 1 m to 4 m) and the turntable was rotated by 360degrees to determine the position of the highest radiation.
3. The receiving Horn antenna was placed 0.5 meters far away from the turntable.
4. The receiving antenna was fixed on the same height with the EUT to find maximum suspected emissions. Recorded suspected value is indicated as Read Level (Raw).
5. Replace the EUT by standard antenna and feed the RF port by signal generator.
6. Adjust the frequency of the signal generator to the suspected emission and slightly rotate the turntable to locate the position with maximum reading.
7. Adjust the power level of the signal generator to reach the same reading with Read

Level (Raw).

8. The level of the spurious emission is the power level of (7) plus the gain of the standard antenna in dBd and minus the loss of the cable used between the signal generator and the standard antenna.

Transmitter Conducted Output Power

1. The transmitter output is connected to the spectrum analyzer through an attenuator.
2. Set RBW of spectrum analyzer to 1MHz and VBW to 3MHz.
3. Record the Conducted Output Power.

4.3 TEST RESULTS

Radio Power

12.5 KHz Channel Separation, 4FSK

Frequency (MHz)	Ant. Pol. (H/V)	SG Reading (dBm)	Cable Loss (dB)	Gain (dBd)	ERP (dBm)	Limit (dBm)	Margin (dB)

5. TRANSMITTER SPURIOUS CONDUCTED EMISSION

5.1 TEST SETUP LAYOUT

5.2 TEST PROCEDURE

1. The transmitter output is connected to the spectrum analyzer through an attenuator.
2. Adjust the spectrum analyzer for the following settings:
 - 1) Resolution Bandwidth = 10 KHz for spurious emissions below 1 GHz, and 1 MHz for spurious emissions above 1 GHz.
 - 2) Video Bandwidth = 300KHz for spurious emissions below 1 GHz, and 3 MHz for spurious emissions above 1 GHz.
 - 3) Sweep Speed slow enough to maintain measurement calibration. Detector Mode = Positive Peak.
3. For 12.5 KHz channel separation, on any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in KHz) for of more than 12.5 KHz: at least $50+10 \log(P)$ dB or 70 dB, whichever is lesser attenuation.
4. For 25 KHz channel separation, on any frequency removed from the center of the authorized bandwidth by more than 250 percent of the authorized bandwidth, at least $43+10 \log(P)$ dB attenuation.

6. TRANSMITTER SPURIOUS RADIATED EMISSION

6.1 TEST SETUP LAYOUT

below 30MHz:

30MHz to 1GHz:

30MHz to 1GHz:

6.2 TEST PROCEDURE

1. Configure the EUT according to ANSI C63.4.
2. The EUT was placed on the top of the turn table 0.8 meter above ground.
3. The phase center of the receiving antenna mounted on the top of a height-variable antenna tower was placed 3 meters far away from the turn table.
4. Power on the EUT and all the supporting units.
5. The turn table was rotated 360 degrees to determine the position of the highest radiation.
6. The height of the broadband receiving antenna was varied between one meter and four meters above ground to find the maximum emission field strength of both horizontal and vertical polarization.
7. For each suspected emission, the antenna tower was scan (from 1m to 4m) and then the turn table was rotated (from 0 degrees to 360 degrees) to find the maximum reading.
8. Adjust the spectrum analyzer for the following settings:
 - 1) Resolution bandwidth = 10 KHz for spurious emissions below 1 GHz and 1MHz for spurious emissions above 1 GHz.
 - 2) Video bandwidth = 300 KHz for spurious emissions below 1 GHz, and 3 MHz for spurious emission above 1 GHz.
 - 3) Sweep Speed slow enough to maintain measurement calibration.
 - 4) Detector Mode = Positive Peak.
9. Remove the transmitter and replace it with a broadband substitution antenna.
10. With the substitution antennas at horizontally polarized and with the signal generator tuned to a particular spurious frequency, raise and lower the test antenna to obtain a maximum reading at the spectrum analyzer. Adjust the level of the signal generator output until the previously recorded maximum reading (item 7). This should be done carefully repeating the adjustment of the test antenna and generator output.
11. $P_d \text{ (dBm)} = P_g \text{ (dBm)} - \text{cable loss (dB)} + \text{antenna gain (dBi)}$. P_d is the dipole equivalent power and P_g is the generator output power into the substitution antenna.
12. For 12.5 KHz channel separation, on any frequency removed from the center of the authorized bandwidth by a displacement frequency (f_d in KHz) for of more than 12.5 KHz: at least $50 + 10 \log(P)$ dB or 70 dB, whichever is lesser attenuation.
13. For 25 KHz channel separation, on any frequency removed from the center of the authorized bandwidth by more than 250 percent of the authorized bandwidth, at least $43 + 10 \log(P)$ dB attenuation.

6.3 TEST RESULTS

12.5KHz Channel Separation, 4FSK, 403MHz

(1) 9KHz to 30MHz

The low frequency, which started from 9KHz to 30MHz, was pre-scanned and the result which was 20dB lower than the limit line, and that was not reported per 2.1057 (c).

(2) 30MHz to 1GHz

Frequency (MHz)	Ant. Pol. (H/V)	SG Reading (dBm)	Cable Loss (dB)	Gain (dBd)	ERP (dBm)	Limit (dBm)	Margin (dB)

7. TRANSMITTER SPECTRUM MASK

7.1 TEST SETUP LAYOUT

7.2 TEST PROCEDURE

1. The transmitter output is connected to the spectrum analyzer through an attenuator.
2. Set RBW of spectrum analyzer to 300Hz and VBW to 1KHz.
3. Mark the frequency with maximum peak power as the center of the display of the spectrum.
4. Set the span to 120KHz and sweep time to Auto.
5. Record the power spectral and compare to the Mask.
6. Limit according to FCC §90.210 and EUT performance, 12.5 KHz: Emission Mask D, 25 KHz: Emission Mask C.

Applicable Emission Masks		
Frequency Band (MHz)	Mask for Equipment with Audio Low Pass Filter	Mask for Equipment Without Audio Low Pass Filter
Below 25 ¹	A or B	A or C
25–50	B	C
72–76	B	C
150–174 ²	B, D, or E	C, D, or E
150 Paging-only	B	C
220–222	F	F
421–512 ²	B, D, or E	C, D, or E
450 Paging-only	B	G
806–809/851–854	B	H
809–824/854–869 ³	B	G
896–901/935–940	I	J
902–928	K	K
929–930	B	G
4940–4990 MHz	L or M	L or M
5850–5925 ⁴	B	C
All other bands	B	C

1 Equipment using single sideband J3E emission must meet the requirements of Emission Mask A. Equipment using other emissions must meet the requirements of Emission Mask B or C, as applicable.

2 Equipment designed to operate with a 25 kHz channel bandwidth must meet the requirements of Emission Mask B or C, as applicable. Equipment designed to operate with a 12.5 kHz channel bandwidth must meet the requirements of Emission Mask D, and equipment designed to operate with a 6.25 kHz channel bandwidth must meet the requirements of Emission Mask E.

3 Equipment used in this licensed to EA or non-EA systems shall comply with the emission mask provisions of §90.691.

4 DSRCS Roadside Units equipment in the 5850–5925 MHz band is governed under subpart M of this part.

8. OCCUPIED BANDWIDTH

8.1 TEST SETUP LAYOUT

8.2 TEST PROCEDURE

1. The transmitter output is connected to the spectrum analyzer through an attenuator.
2. Using Occupied Bandwidth measurement function of spectrum analyzer, and setting as those: Center Frequency=fundamental frequency, RBW=100Hz, VBW=300Hz and Span=50KHz.
3. According to FCC Part 90 Section 90.209, the authorized shall be 11.25KHz for 12.5KHz channel separation, and he authorized shall be 20KHz for 25KHz channel separation

8.3 TEST RESULTS

12.5 KHz Channel Separation, 4FSK

Frequency (MHz)	26dB Bandwidth (KHz)	99% Occupied Bandwidth (KHz)	Max. Limit (KHz)	Test Result

9. FREQUENCY STABILITY

9.1 TEST SETUP LATOUT

9.2 TEST PROCEDURE

1. Setup the configuration per schematic diagram in section 9.1.
2. Set RBW of spectrum analyzer to 1KHz and VBW to 1KHz.
3. According to the part2.1055(a)(1), the EUT was evaluated over the temperature range -30°C to $+50^{\circ}\text{C}$
4. The temperature was initially set to -30°C and a 1-hour period was observed for stabilization of the EUT. The frequency stability was measured within one minute after application of primary power to the transmitter. The temperature was raised at intervals of 10 degrees centigrade through the range. A 1/2-hour period was observed to stabilize the EUT at each measurement step and the frequency stability was measured within one minute after application of primary power to the transmitter. Additionally, according to the part2.1055(d)(1), the power supply voltage of the EUT was varied $\pm 15\%$ nominal input voltage.
5. Read the frequency of the carrier and calculate the deviation.

9.3 TEST RESULTS

12.5 KHz Channel Separation, 4FSK

Frequency Stability under Extreme Temperature

10. TRANSIENT FREQUENCY BEHAVIOR OF TRANSMITTER

10.1 TEST SETUP LATOUT

10.2 TEST PROCEDURE

1. SG to the assigned transmitter frequency and modulate it with a 1KHz tone at $\pm 25\text{KHz}$ deviation and set its output level to below 30dB of EUT signal level to receiver..
2. Set the horizontal sweep rate on the storage oscilloscope to 10ms per division and adjust the display to continuously view the 1000Hz tone from the DOP. Adjust the vertical amplitude control of the oscilloscope to display the 1000Hz at ± 4 divisions vertically centered on the display.
3. Transmitter on and observe the stored display. The output at the DOP, due to the change in the ratio of power between the signal generator input power and the transmitter output power will, because of the capture effect of the test receiver, produce a change in display: For the first part of the sweep it will show the 1KHz test signal. Then once the receiver's demodulator has been captured by the transmitter power, the display will show the frequency difference from the assigned frequency to the actual transmitter frequency versus time. The instant when the 1KHz test signal is completely suppressed (including any capture time due to phasing) is considered to be t_{on} . The trace should be maintained within the allowed divisions during the period t_1 and t_2 . See the figure in the appropriated standards section.
4. . During the time from the end of t_2 to the beginning of t_3 the frequency difference should not exceed the limits set by the FCC in 47 CFR 90.214 and outline in 3.22. The allowed limit is equal to the transmitter frequency times its FCC frequency tolerance ± 4 display divisions divided by 25KHz. For example, at the transmitter assigned frequency of 500MHz and a frequency tolerance of 5ppm. This would be 500MHz times 5ppm times ± 4 divisions divided by 25KHz. This equals ± 0.4 divisions in this example. Greater vertical sensitivity may be required to view this accurately.

- Adjust the oscilloscope trigger controls so it will trigger on a decreasing magnitude from the RF peak detector, at 1 division from the right side of the display, when the transmitter is turned off. Set the controls to store the display. The moment when the 1KHz test signal starts to rise is considered to provide t_{off} .

10.3 TEST RESULTS

12.5 KHz Channel Separation:

403MHz Off to On

403MHz On to Off

450MHz Off to On

450MHz On to Off

473MHz Off to On

473MHz On to Off

25 KHz Channel Separation:

403MHz Off to On

403MHz On to Off

450MHz Off to On

450MHz On to Off

473MHz Off to On

473MHz On to Off

APPENDIX 1 PHOTOGRAPHS OF TEST SETUP

Please refer to the file named “i80 WXYZ RF Setup Photos”.

APPENDIX 2 PHOTOGRAPHS OF EUT

Please refer to the files named “i80 WXYZ_EUT External Photos” and “i80 WXYZ_EUT Internal Photos”.
