2 Summary of Test Results

Applied Standard: CFR 47 FCC Rules and Regulations Part 15 – Radio Frequency Devices Subpart E – Unlicensed National Information Infrastructure Devices

The EUT described in clause 1 was tested according to the applied standard shown above. Details of the test configuration is shown in clause 6.

The conclusion for the test items of which are required by the applied standard is indicated under the test result.

\boxtimes	- T]	he test	result	was r	oassed fo	or the te	st requ	irement	s of the	applie	d standar	·d.
	- T	he test	result	was f	ailed for	the tes	t requii	rements	of the a	applied	standard	l.
	- T	he test	result	was r	not iudge	ed the te	est requ	iremen	ts of the	applie	d standa	rd.

In the approval of test results,

- Determining compliance with the limits in this report was based on the results of the compliance measurement, not taking into account measurement instrumentation uncertainty.
- No deviations were employed from the applied standard.

- No modifications were conducted by JQA to achieve compliance to the limitations.

6.3 Operating Condition

Test Voltage : 4.0VDC (Internal Lithium-ion Battery UBATIA264AFZZ 3900mAh)

Operation Mode :

The EUT is set with the test mode, the specification of the test mode is as followings.

Transmitting frequency : 5180.0 MHz(36CH) -5700.0MHz(140CH): IEEE802.11a/n/ac(20MHz)

: 5190.0 MHz(38CH) –5670.0MHz(134CH): IEEE802.11n/ac(40MHz)

The equipment has two antennas(Main Antenna[ANT0]/Sub Antenna[ANT1]), and uses the MIMO technology.

This equipment works only in 2TX(Main+Sub) mode, and it does not operate in 1TX mode.

Therefore, the radiated emission tests were carried out in the following mode.

2TX (Main+Sub)

Other Clock Frequency 19.2MHz, 48MHz, 12MHz, 27.12MHz

The EUT was rotated through three orthogonal axis (X, Y and Z axis) in radiated measurement.

The EUT with temporary antenna port was used in conducted measurement.

Standard : CFR 47 FCC Rules and Regulations Part 15

DIRECTIONAL ANTENNA GAIN

For Power: The TX chains are uncorrelated and the antenna gain is the same for each chain. The directional gain is equal to the antenna gain.

Antenna	Antenna	Directional
Gain [dBi]	Gain [dBi]	Gain [dBi]
2.14	2.14	2.14

For PSD: The TX chains are correlated. The directional gain is:

7.1.3 Test Method and Test Setup (Diagrammatic illustration)

The occupied bandwidth measurements were carried out connecting to the spectrum analyzer.

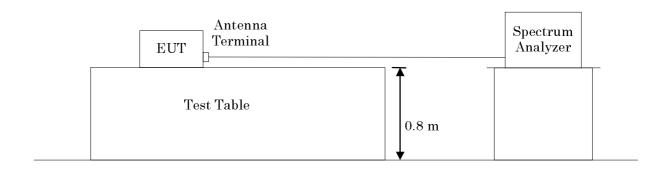

The spectrum analyzer was set in accordance with KDB 789033 D02 as follows:.

The RBW was set approximately 1% of the emission bandwidth.

Set the VBW > RBW., Detector = Peak, and Trace mode = max hold.

The bandwidth function in the analyzer was used.

7.2.3 Test Method and Test Setup (Diagrammatic illustration)

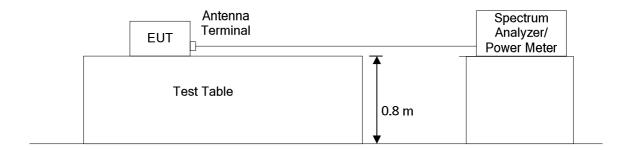

The maximum conducted output power measurements were carried out connecting to the power meter and the pulse power sensor or spectrum analyzer listed above.

Measurement Method:

- 1) WLAN 20 MHz/40 MHz BW mode KDB 789033 D02 E.3.a) Method PM (Measurement using an RF average power meter)
- 2) WLAN 80 MHz BW mode KDB 789033 D02 E.2.d) Method SA-2 (trace averaging across on and off times of the EUT transmissions, followed by duty cycle correction)

The EUT transmits non-continuously therefore the duty cycle measurements were performed. The measurements of duty cycle and transmission duration were performed connecting to the spectrum analyzer in accordance with KDB 789033 D02 Method B.2. as follows; Span: Zero/ RBW: $8\,\mathrm{MHz}/\mathrm{VBW} \geq 8\,\mathrm{MHz}/\mathrm{Sweep}$: Auto/ Detector: Peak

7.5.3 Test Method and Test Setup (Diagrammatic illustration)

The preliminary tests were performed using the scan mode of test receiver or spectrum analyzer to observe the emissions characteristics of the EUT.

The EUT configuration, cable configuration and mode of operation were determined for producing the maximum level of emissions.

This configurations was used for final tests.

7.6.4.2 Unwanted Radiated Emission 9 kHz – 30 MHz

Test Date: April 30, 2015

Temp.:22°C, Humi:48%

Mode of EUT: All mode have been investigated in accordance with clause 6.3 in this report.

Results: No spurious emissions in the range 20dB below the limit.

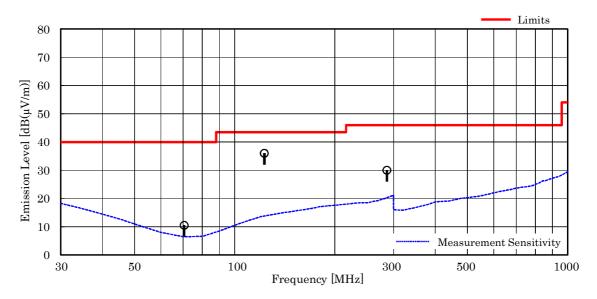

7.6.4.3 Unwanted Radiated Emission 30 MHz – 1000 MHz

Mode of EUT: All modes have been investigated and the worst case mode for channel (36ch: 5180MHz / IEEE802.11a) has been listed.

Calculated result at 6920.0 MHz, as the worst point shown on underline:

Antenna Factor = 29.8 dB(1/m) Corr. Factor = -15.6 dB +) Meter Reading = 32.4 dB(μ V) Result = 46.6 dB(μ V/m)

Minimum Margin: 54.0 - 46.6 = 7.4 (dB)

NOTES

- 1. Test Distance : 3 m (1 GHz to 26.5 GHz) / 1m (26.5 GHz to 40 GHz)
- 2. The spectrum was checked from 1 GHz to 40 GHz.
- 3. The correction factor is shown as follows:

Corr. Factor [dB] = Cable Loss + 20dB Pad Att. - Pre-Amp. Gain [dB] (1.0 - 7.6GHz)

Corr. Factor [dB] = Cable Loss + 10dB Pad Att. - Pre-Amp. Gain [dB] (7.6 - 18.0GHz)

7.7.3 Test Method and Test Setup (Diagrammatic illustration)

The Dynamic Frequency Selection(DFS) measurements were carried out in accordance with FCC Part 15.407(h) and KDB905462 D02 UNII DFS Compliance Procedures New Rules "COMPLIANCE MEASUREMENT PROCEDURES FOR UNII DEVICES OPERATIONG IN THE 5250-5350 MHz AND 5470-5725 MHz BANDS INCORPORATING DYNAMIC FREQUENCY SELECTION".

7.7.3.1 DFS Detection Threshold and DFS Response Requirement

DFS Detection Thresholds for Master Devices and Client Devices With Radar Detection

Maximum Transmit Power	Value		
	(See Notes 1, 2 and 3)		
≥ 200 milliwatt	-64 dBm		
EIRP < 200 milliwatt and	-62 dBm		
power spectral density < 10 dBm/MHz			
EIRP < 200 milliwatt that do not meet the power	-64 dBm		
spectral density requirement			

Note 1: This is the level at the input of the receiver assuming a 0 dBi receive antenna.

Note 2: Throughout these test procedures an additional 1 dB has been added to the amplitude of the test transmission waveforms to account for variations in measurement equipment. This will ensure that the test signal is at or above the detection threshold level to trigger a DFS response.

Note3: EIRP is based on the highest antenna gain. For MIMO devices refer to KDB Publication 662911 D01.

Table 4: DFS Response Requirement Values

Parameter	Value
Non-Occupancy Period	Minimum 30 minutes
Channel Availability Check Time	60 seconds
Channel Move Time	10 seconds (See Note 1.)
Channel Closing Transmission Time	200 milliseconds + an aggregate of 60 milliseconds over
	remaining 10 second period. (See Notes 1 and 2.)
U-NII Detection Bandwidth	Minimum 100% of the U-NII 99% transmission power
	bandwidth. (See Note 3.)

Note 1: Channel Move Time and the Channel Closing Transmission Time should be performed with Radar Type 0. The measurement timing begins at the end of the Radar Type 0 burst.

Note 2: The Channel Closing Transmission Time is comprised of 200 milliseconds starting at the beginning of the Channel Move Time plus any additional intermittent control signals required to facilitate a Channel move (an aggregate of 60 milliseconds) during the remainder of the 10 second period. The aggregate duration of control signals will not count quiet periods in between transmissions.

Note 3: During the U-NII Detection Bandwidth detection test, radar type 0 is used and for each frequency step the minimum percentage of detection is 90 percent. Measurements are performed with no data traffic.

7.7.3.2 Radar Test Waveforms

This section provides the parameters for required test waveforms, minimum percentage of successful detections, and the minimum number of trials that must be used for determining DFS conformance. Step intervals of 0.1 microsecond for Pulse Width, 1 microsecond for PRI, 1 MHz for chirp width and 1 for the number of pulses will be utilized for the random determination of specific test waveforms.

Short Pulse Radar Test Waveforms

Radar	Pulse Width	PRI	Number	Minimum	Minimum
Type	(μsec)	(μsec)	of Pulses	Percentage of	Number of
				Successful	Trials
			Detection		
0	1	1428	18	See Note1	See Note1
1	1	See KDB90	5462 D02	60%	40
2	1-5	150-230	23-29	60%	30
3	6-10	200-500	16-18	60%	30
4	11-20	200-500	12-16	60%	30
Aggregate (Radar Types 1-4)		<u>-</u>	80%	120

Note 1: Short Pulse Radar Type 0 should be used for the detection bandwidth test, channel move time, and channel closing time tests.

A minimum of 30 unique waveforms are required for each of the Short Pulse Radar Types 2 through 4. For Short Pulse Radar Type 0, the same waveform is used a minimum of 30 times. If more than 30 waveforms are used for Short Pulse Radar Types 2 through 4, then each additional waveform must also be unique and not repeated from the previous waveforms. The aggregate is the average of the percentage of successful detections of Short Pulse Radar Types 1-4.

Long Pulse Radar Test Waveforms

Radar	Pulse Width	Chirp	PRI	Number	Number	Minimum	Minimum
Type	(µsec)	Width	(µsec)	of Pulses	of Bursts	Percentage of	Number of
		(MHz)		per <i>Burst</i>		Successful	Trials
						Detection	
5	50-100	5-20	1000-2000	1-3	8-20	80%	30

The parameters for this waveform are randomly chosen. Thirty unique waveforms are required for the Long Pulse Radar Type waveforms. If more than 30 waveforms are used for the Long Pulse Radar Type waveforms, then each additional waveform must also be unique and not repeated from the previous waveforms. Each waveform is defined as follows:

- 1) The transmission period for the Long Pulse Radar test signal is 12 seconds.
- 2) There are a total of 8 to 20 Bursts in the 12 second period, with the number of Bursts being randomly chosen. This number is Burst_Count.
- 3) Each Burst consists of 1 to 3 pulses, with the number of pulses being randomly chosen. Each Burst within the 12 second sequence may have a different number of pulses.
- 4) The pulse width is between 50 and 100 microseconds, with the pulse width being randomly chosen. Each pulse within a Burst will have the same pulse width. Pulses in different Bursts may have different pulse widths.
- 5) Each pulse has a linear frequency modulated chirp between 5 and 20 MHz, with the chirp width being randomly chosen. Each pulse within a Burst will have the same chirp width. Pulses in different Bursts may have different chirp widths. The chirp is centered on the pulse. For example, with a radar frequency of 5300 MHz and a 20 MHz chirped signal, the chirp starts at 5290 MHz and ends at 5310 MHz.
- 6) If more than one pulse is present in a Burst, the time between the pulses will be between 1000 and 2000 microseconds, with the time being randomly chosen. If three pulses are present in a Burst, the random time interval between the first and second pulses is chosen independently of the random time interval between the second and third pulses.
- 7) The 12 second transmission period is divided into even intervals. The number of intervals is equal to Burst_Count. Each interval is of length (12,000,000 / Burst_Count) microseconds. Each interval contains one Burst. The start time for the Burst, relative to the beginning of the interval, is between 1 and [(12,000,000 / Burst_Count) (Total Burst Length) + (One Random PRI Interval)] microseconds, with the start time being randomly chosen. The step interval for the start time is 1 microsecond. The start time for each Burst is chosen independently.

Frequency Hopping Radar Test Waveform

Radar	Pulse	PRI	Pulses	Hopping	Hopping	Minimum	Minimum
Type	Width	(µsec)	per	Rate	Sequence	Percentage of	Number of
	(µsec)		Hop	(kHz)	Length	Successful	Trials
					(msec)	Detection	
6	1	333	9	0.333	300	70%	30

For the Frequency Hopping Radar Type, the same Burst parameters are used for each waveform. The hopping sequence is different for each waveform and a 100-length segment is selected from the hopping sequence defined by the following algorithm:

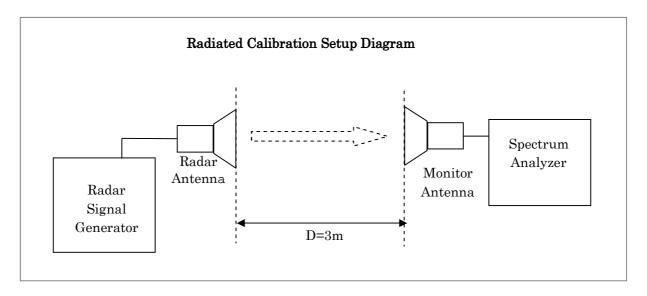

The first frequency in a hopping sequence is selected randomly from the group of 475 integer frequencies from 5250 - 5724 MHz. Next, the frequency that was just chosen is removed from the group and a frequency is randomly selected from the remaining 474 frequencies in the group. This process continues until all 475 frequencies are chosen for the set. For selection of a random frequency, the frequencies remaining within the group are always treated as equally likely.

7.7.3.3 Rader Waveform Calibration

The EUT is the client device without radar detection, then master device is a RDD. Therefore the radar test signal level is set at the Radar Detection Threshold Level of master device.

The Radar Detection Threshold Level is employed -64dBm + 1dB = -63 dBm at the antenna port.

Where the antenna gain of master device is X dBi then the threshold level is corrected as

"-63 - X" dBm (Rated output power and Antenna Gain of the master device is described in EUT Description).

The spectrum analyzer is connected to the monitor antenna via a coaxial cable. The antenna is set vertical polarization for testing. The reference level offset of a spectrum analyzer set to "Monitoring Antenna Gain – Cable loss". The Radar Signal Generator is set to CW output mode and the signal level is adjusted to "-63 – X" dBm on the spectrum analyze setting as below;

Frequency: Radar Signal Frequency Span: Zero Span(Time Domain)

RBW/VBW: 3 MHz Detection: Peak

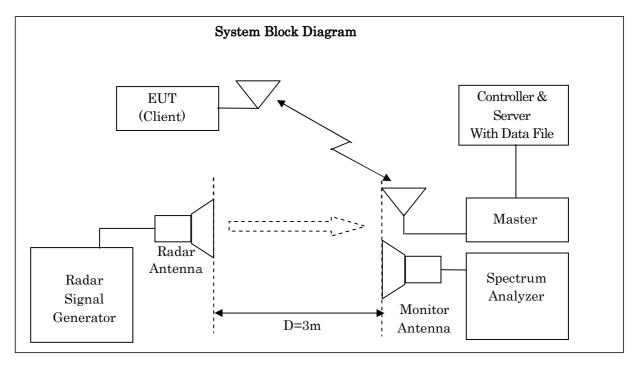

The spectrum analyzer plots of the calibrated radar waveform on the Channel frequency is attached in clause 7.7.5.1 in this report.

7.7.3.4 Test Setup and Operation Radiated Method

Support Equipment: The following support equipment was used for in this DFS testing

Item	Manufacturer	Model No.	Serial No.	FCC ID
Wireless Access Point	Cisco	AIR-AP1042N-A-K9	FTX1637E2NC	LDK102070
AC Adaptor for AP	Cisco	AA2548L	ALD0516GFDA	N/A
Wireless Access Point	HP	JG993A	CN4AGTG05K	O9C-BJNGAFB0004
Unified WLAN Switch	HP	JG641A	CN49G5Q053	N/A
PC(Controller/Server)	HP Compaq	D330 uT	JPA42500TB	DoC

Used Test File and Displayed Traffic Level Adjustment:

The test is performed with the designated MPEG test file that is streamed from the access point to the client in full motion video mode using the media player with the V2.61 Codec package. This file is used by IP and Frame based systems for loading the test channel during the In-service compliance testing of the U-NII device.

By control PC, the radio link is established between the master and slave and the test file in saver(PC) is streamed via master(access point) to generate WLAN traffic.

The monitoring antenna is adjusted so that the WLAN traffic level on the spectrum analyzer is lower than the radar detection threshold level.

The spectrum analyzer plots of the slave(EUT) data traffic plot is attached in clause 7.7.5.2 and the nominal noise floor plots is attached in clause 7.7.5.3 in this report.

System Architecture	IEEE802.11 a/n/ac, IP based system
TPC Description	N/A(Not Required EIRP below 500 mW)
Data Rate/ Channel Bandwidth	Refer below table.
Power-on Cycle	N/A(No Channel Availability Check Function)

^(*1) The rated output power of the master device is greater than 23dBm(EIRP), then the interference threshold level is employed -64 dBm. After correction for procedural adjustments, the radiated threshold level at the master device are;

^{-64 + 1 - 3} dBi(Master antenna Gain) = -66 dBm or

^{-64 + 1 - 5} dBi(Master antenna Gain) = -68 dBm.

7.7.4.4 Channel Move Time

The channel move time is measured using delta-marker function of the spectrum analyzer. The reference marker is adjusted at the end of radar pulse and the delta marker is adjusted at the end the WLAN transmission. The displayed delta value is the result of move time. It shall be within the 10 seconds. The measurements are carried out 802.11n CH.100 (5500MHz)/ 20 MHz BW, 802.11n CH.102(5510 MHz)/ 40 MHz BW and 802.11ac CH.106(5530 MHz)/ 80 MHz BW.

7.7.4.5 Channel Closing Transmission Time

The aggregate channel closing transmission time is calculated as follows;

 \boldsymbol{D} is the dwell time per spectrum analyzer sampling bin.

S is the sweep time.

B is the number of spectrum analyzer sampling bin.

N is the number of spectrum analyzer sampling bins showing a UNII transmission(intermittent control signal).

Channel Closing Time = D * N = S / B * N

The observation period over which the aggregate transmission time is calculated begins at (the reference marker + 200 msec.) and end on earlier than (the reference marker + 10 sec.).

The measurements are carried out 802.11n CH.100 (5500MHz)/ 20 MHz BW, 802.11n CH.102(5510 MHz)/ 40 MHz BW and 802.11ac CH.106(5530 MHz)/ 80 MHz BW.

Test Results

Channel	Frequency	Mode	Sweep Time(S)	(B)	(N)	Channel Closing
	(MHz)		(msec)			Time (msec)
100	5500	20 MHz BW	1000	500	0	0
102	5510	40 MHz BW	1000	500	0	0
106	5530	80 MHz BW	4000	2000	8	16

The test result (Channel Closing Time) is calculated as follows;

For 106 channel (5530 MHz)

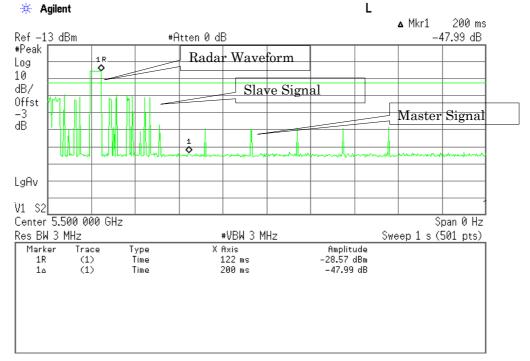

Channel Closing Time = D * N = S / B * N = 4000 / 2000 * 8 = 16 msec

7.7.4.6 Non-Occupancy Period

During the 30 minutes observation time, EUT did not make any transmissions on a channel. The measurements are carried out 802.11n CH.100 (5500MHz)/ 20 MHz BW, 802.11n CH.102(5510 MHz)/ 40 MHz BW and 802.11ac CH.106(5530 MHz)/ 80 MHz BW.
