According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance \leq 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] $\cdot \left[\sqrt{f(GHz)}\right] \le 3.0$

The tune-up power is 6 dBm +/- 2 dB, therefore the highest tune-up power is 6.73 dBm (4.71 mW) @ 2441 MHz

When the minimum *test separation distance* is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So, (4.71mW / 5mm) * (2.441GHz ^0.5)= 1.5

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] * [$\sqrt{f}(GHz)$] = 1.5 < 3.0

Therefore, standalone SAR measurements are not required for both head and body.
