WN8 9PN

The test results only relate to the items tested.

This report shall not be reproduced except in full without the written approval of the testing laboratory.

Executive Summary

The Smart Tag is a new ankle worn tracking device (Portable Device) from buddi Limited operating in the 850 MHz and 1900 MHz frequency range. The device has an integrated antenna and work in the GPRS 850 (Class 10) and GPRS 1900 (Class 10) and 900 MHz SRD standards. Since the Smart Tag is an ankle worn device, According KDB 447498 D01, IMST has conducted SAR measurements for extremity exposure configuration.

The objective of the measurements done by IMST was the dosimetric assessment of one device in GPRS 850 and GPRS 1900, worst case configuration according the applicable KDB. Based on the KDB 648474 [KDB 648474] measurements for SRD are not required since the output power is below the threshold. The examinations have been carried out with the dosimetric assessment system „DASY4“.

Since the housing of the device has a curved surface, a KDB inquiry (127393) was send to the FCC. Accordingly, the SAR assessment was conducted without housing and with zero separation distance to the flat part of the SAM phantom.

The measurements were made according to the 47 CFR § 2.1093 [47CFR] for evaluating compliance of mobile and portable devices with FCC limits for human exposure (general population) to radiofrequency emissions and IEEE 1528-2013 [IEEE1528-2013].

Additional information and guidelines given by the following FCC documents were used:

- SAR Measurement Requirements for 100 MHz to 6 GHz [KDB 865664 D01 v01r03]
- Mobile and Portable Devices RF Exposure Procedures and Equipment Authorization Policies [KDB 447498 D01 v05r02]
- Recommended SAR Test Reduction Procedures for GSM/GPRS/EDGE [KDB 941225 D03 vo1]

All measurements have been performed in accordance to the recommendations given by SPEAG.

Compliance Statement

The assessed SAR values for Smart Tag device from buddi Limited (FCC ID: ZDLST1) are in compliance with the SAR limits over any 10g tissue according to:

- 47 CFR § 2.1093 [47CFR]
- ANSI / IEEE C95.1-1999 [IEEE C95.1-1999]

All measured SAR results are shown in Table 8.

Worst Case SAR Results								
Band	Freq. [MHz]	CH	Phantom Configuration		Fig. No.	Reported SAR _{10g} [W/kg]	Limit SAR _{10g} [W/kg]	
GPRS 850	836.6	190	Extremity	Back	11	1.164	4.0	PASS
GPRS 1900	1880	661	Exposure	Back	11	1.878	4.0	PASS

1 Subject of Investigation

The Smart Tag is a new ankle worn tracking device (Portable Device) from buddi Limited operating in the 850 MHz and 1900 MHz frequency range. The device has an integrated antenna and work in the GPRS 850 (Class 10) and GPRS 1900 (Class 10) and 900 MHz SRD standards. Since the Smart Tag is an ankle worn device, According KDB 447498 D01, IMST has conducted SAR measurements for extremity exposure configuration.

Fig. 1: Picture of the device under test.

The objective of the measurements done by IMST was the dosimetric assessment of one device in GPRS 850 and GPRS 1900, worst case configuration according the applicable KDB. Based on the KDB 648474 [KDB 648474] measurements for SRD are not required since the output power is below the threshold. The examinations have been carried out with the dosimetric assessment system „DASY4“.

2 FCC Exposure Criteria

In the USA the FCC exposure criteria [KDB 865664] are based on the withdrawn IEEE Standard C95.1-1999 [IEEE C95.1-1999].

In this report the comparison between the FCC exposure limits and the measured data is made using the spatial peak SAR; the power level of the device under test guarantees that the whole body averaged SAR is not exceeded.

Having in mind a worst case consideration, the SAR limit is valid for uncontrolled environment and mobile respectively portable transmitters. According to Table 1 the SAR values have to be averaged over a mass of 10 g (SAR_{10g}) with the shape of a cube.

Rule	Extremity SAR Limit 10g [W/kg]
47 CFR § 2.1093 (d)(2)	4.0

Table 1: Relevant spatial peak SAR limit averaged over a mass of 1 g and 10 g.

2.1 Distinction Between Exposed Population, Duration of Exposure and Frequencies

The American Standard [IEEE C95.1-1999] distinguishes between controlled and uncontrolled environment. Controlled environments are locations where there is exposure that may be incurred by persons who are aware of the potential for exposure as a concomitant of employment or by other cognizant persons. Uncontrolled environments are locations where there is the exposure of individuals who have no knowledge or control of their exposure. The exposures may occur in living quarters or workplaces. For exposure in controlled environments higher field strengths are admissible. In addition the duration of exposure is considered.

Due to the influence of frequency on important parameters, as the penetration depth of the electromagnetic fields into the human body and the absorption capability of different tissues, the limits in general vary with frequency.

2.2 Distinction between Maximum Permissible Exposure and SAR Limits

The biological relevant parameter describing the effects of electromagnetic fields in the frequency range of interest is the specific absorption rate SAR (dimension: power/mass). It is a measure of the power absorbed per unit mass. The SAR may be spatially averaged over the total mass of an exposed body or its parts. The SAR is calculated from the r.m.s. electric field strength E inside the human body, the conductivity σ and the mass density ρ of the biological tissue:

$$SAR = \sigma \frac{E^2}{\rho} = c \frac{\partial T}{\partial t} \Big|_{t \rightarrow 0+} \quad (1)$$

The specific absorption rate describes the initial rate of temperature rise $\partial T / \partial t$ as a function of the specific heat capacity c of the tissue. A limitation of the specific absorption rate prevents an excessive heating of the human body by electromagnetic energy.

As it is sometimes difficult to determine the SAR directly by measurement (e.g. whole body averaged SAR), the standard specifies more readily measurable maximum permissible exposures in terms of external electric E and magnetic field strength H and power density S , derived from the SAR limits. The limits for E , H and S have been fixed so that even under worst case conditions, the limits for the specific absorption rate SAR are not exceeded.

For the relevant frequency range the maximum permissible exposure may be exceeded if the exposure can be shown by appropriate techniques to produce SAR values below the corresponding limits.

3 The FCC Measurement Procedure

3.1 General Requirements

The test shall be performed in a laboratory with an environment which avoids influence on SAR measurements by ambient EM sources and any reflection from the environment itself. The ambient temperature shall be in the range of 20°C to 26°C and 30-70% humidity. All tests have been conducted according the latest version of all relevant KDBs.

4 Body-worn Configurations

Body-worn operating configurations are tested with the belt-clips and holsters attached to the device and positioned against a flat phantom in a normal use configuration. Per FCC KDB 648474 [KDB 648474], Body-worn accessory exposure is typically related to voice mode operations when handsets are carried in body-worn accessories. The body-worn accessory procedures in KDB 447498 [KDB 447498] should be used to test for body-worn accessory SAR compliance, without a headset connected to it. This enables the test results for such configuration to be compatible with that required for hotspot mode when the body worn accessory test separation distance is greater than or equal to that required for hotspot mode, when applicable. When the reported SAR for body worn accessory, measured without headset connected to the handset, is $> 1.2 \text{ W/kg}$, the highest reported SAR configuration for that wireless mode and frequency band should be repeated for that body worn accessory with a headset attached to the handset.

For purpose of determining test requirements, accessories may be divided into two categories: those that do not contain metallic components and those that do. For multiple accessories that do not contain metallic components, the device may be tested only with that accessory which provides the closest spacing to the body.

For multiple accessories that contain metallic components, the device must be tested with each accessory that contains a unique metallic component. If multiple accessories share an identical metallic component, only the accessory that provides the closest spacing to the body must be tested.

Devices that are designed to operate on the body of users using lanyards and straps, or without requiring additional body worn accessories, must be tested for SAR compliance using a conservative minimum test separation distance $\leq 5 \text{ mm}$ to support compliance. Nevertheless, all accessories that contain metallic components must be tested for compliance additionally.

Other separation distances may be used, but they shall not exceed 2.5 cm.

4.1 Extremity exposure conditions

Devices that are designed or intended for use on extremities or mainly operated in extremity only exposure conditions; i.e. hands, wrist, feet and ankles, may require extremity SAR evaluation according 4.2.3 of KDB 447498 D01.

4.2 Phantom Requirements

For body-worn and other configurations a flat phantom shall be used which is comprised of material with electrical properties similar to the corresponding tissues.

4.3 Test to be Performed

For devices with retractable antenna the SAR test shall be performed with the antenna fully extended and fully retracted. Other factors that may affect the exposure shall also be tested. For example, optional antennas or optional battery packs which may significantly change the volume, lengths, flip open/closed, etc. of the device, or any other accessories which might have the potential to considerably increase the peak spatial-average SAR value.

The SAR test shall be performed at the high, middle and low frequency channels of each operating mode. If the SAR measured at the middle channel resp. that channel with the highest output power for each test configuration is $< 0.4 \text{ W/kg}$, testing at the high and low channels is optional.

4.3.1 Measurement Variability

According KDB 865664 repeated measurements are required only when the measured SAR is $\geq 0.80 \text{ W/kg}$. If the measured SAR value of the initial repeated measurement is $< 1.45 \text{ W/kg}$ with $\leq 20\%$ variation, only one repeated measurement is required to reaffirm that the results are not expected to have substantial variations, which may introduce significant compliance concerns. A second repeated measurement is required only if the measured result for the initial repeated measurement is within 10% of the SAR limit and vary by more than 20%, which are often related to device and measurement setup difficulties. The following procedures are applied to determine if repeated measurements are required.

- 1) Repeated measurement is not required when the original highest measured SAR is $< 0.80 \text{ W/kg}$; steps 2) through 4) do not apply.
- 2) When the original highest measured SAR is $\geq 0.80 \text{ W/kg}$, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is > 1.20 or when the original or repeated measurement is $\geq 1.45 \text{ W/kg}$ ($\sim 10\%$ from the 1-g SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is $\geq 1.5 \text{ W/kg}$ and the ratio of largest to smallest SAR for the original, first and second repeated measurements is > 1.20 .

5 The Measurement System

DASY is an abbreviation of „Dosimetric Assessment System“ and describes a system that is able to determine the SAR distribution inside a phantom of a human being according to different standards. The DASY4 system consists of the following items as shown in Fig. 2. Additional Fig. 3 show the equipment, similar to the installations in other laboratories.

- Fully compliant with all current measurement standards as stated in Fig. 6
- High precision robot with controller
- Measurement server (for surveillance of the robot operation and signal filtering)
- Data acquisition electronics DAE (for signal amplification and filtering)
- Field probes calibrated for use in liquids
- Electro-optical converter EOC (conversion from the optical into a digital signal)
- Light beam (improving of the absolute probe positioning accuracy)
- Two SAM phantoms filled with tissue simulating liquid
- DASY4 software
- SEMCAD

Fig. 2: The DASY4 measurement system.

Fig. 3: The measurement set-up with two SAM phantoms containing tissue simulating liquid.

The mobile phone operating at the maximum power level is placed by a non metallic device holder (delivered from Schmid & Partner) in the above described positions at a shell phantom of a human being. The distribution of the electric field strength E is measured in the tissue simulating liquid within the shell phantom. For this miniaturised field probes with high sensitivity and low field disturbance are used. Afterwards the corresponding SAR values are calculated with the known electrical conductivity σ and the mass density ρ of the tissue in the SEMCAD FDTD software. The software is able to determine the averaged SAR values (averaging region 1 g or 10 g) for compliance testing.

The measurements are done by two scans: first a coarse scan determines the region of the maximum SAR, afterwards the averaged SAR is measured in a second scan within the shape of a cube. The measurement time takes about 20 minutes.

5.1 Phantoms

TWIN SAM PHANTOM V4.0	
	Specific Anthropomorphic Mannequin defined in IEEE 1528 and IEC 62209-1 and delivered by Schmid & Partner Engineering AG. It enables the dosimetric evaluation of left and right hand phone usage as well as body mounted usage at the flat phantom region. The details and the Certificate of conformity can be found in Fig. 7.
Shell Thickness	2 ± 0.2 mm (6 ± 0.2 mm at ear point)
Dimensions	Length: 1000 mm; Width: 500 mm Height: adjustable feet
Filling Volume	approx. 25 liters

5.2 E-Field-Probes

For the measurements the Dosimetric E-Field Probes ET3DV6R or EX3DV4 with following specifications are used. They are manufactured and calibrated in accordance with KDB 865664 and IEEE [IEEE 1528-2003] recommendations annually by Schmid & Partner Engineering AG.

ET3DV6R	
Construction	Symmetrical design with triangular core Built-in optical fiber for surface detection system (ET3DV6 only) Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Dimensions	Overall length: 337 mm (Tip: 16 mm) Tip diameter: 6.8 mm (Body: 12 mm) Distance from probe tip to dipole centers: 2.7 mm
Frequency	10 MHz to 2.3 GHz Linearity: ± 0.2 dB (30 MHz to 2.3 GHz)
Directivity	Axial isotropy: ± 0.2 dB in TSL (rotation around probe axis) Spherical isotropy: ± 0.4 dB in TSL (rotation normal to probe axis)
Dynamic Range	5 μ W/g to > 100 mW/g; Linearity: ± 0.2 dB
Calibration Range	450 MHz / 750 MHz / 900 MHz / 1750 MHz / 1900 MHz / 1950 MHz for head and body simulating liquid

EX3DV4	
Construction	Symmetrical design with triangular core Built-in shielding against static charges PEEK enclosure material (resistant to organic solvents, e.g., DGBE)
Dimensions	Overall length: 337 mm (Tip: 20 mm) Tip diameter: 2.5 mm (Body: 12 mm) Typical distance from probe tip to dipole centers: 1 mm
Frequency	10 MHz to > 6 GHz Linearity: ± 0.2 dB (30 MHz to 6 GHz)
Directivity	Axial isotropy: ± 0.3 dB in TSL (rotation around probe axis) Spherical isotropy: ± 0.5 dB in TSL (rotation normal to probe axis)
Dynamic Range	10 μ W/g to > 100 mW/g Linearity: ± 0.2 dB (noise: typically < 1 μ W/g)
Calibration Range	1950 MHz / 2450 MHz / 2600 MHz / 3500 MHz / 5200 MHz / 5300 MHz / 5600 MHz / 5800 MHz for head and body simulating liquid

5.3 Measurement Procedure

The following steps are used for each test position:

- Establish a call with the maximum output power with a base station simulator or by software. The connection between the mobile phone and the base station simulator is established via air interface.
- Measurement of the local E-field value at a fixed location (P1). This value serves as a reference value for calculating a possible power drift.
- Measurement of the SAR distribution with resolution settings for area scan and zoom scan according KDB 865664 D01 as shown in Table 2.
- The used extrapolation and interpolation routines are all based on the modified Quadratic Shepard's method [DASY4].
- Repetition of the E-field measurement at the fixed location (P1) and repetition of the whole procedure if the two results differ by more than $\pm 0.21\text{dB}$.

			≤ 3 GHz	≥ 3 GHz
Maximum distance from closest measurement point (geometric center of probe sensors) to phantom surface			5 ± 1 mm	½·δ·ln(2) ± 0.5 mm
Maximum probe angle from probe axis to phantom surface normal at the measurement location			30° ± 1°	20° ± 1°
Maximum area scan spatial resolution: Δx _{Area} , Δy _{Area}			≤ 2 GHz: ≤ 15 mm 2 - 3 GHz: ≤ 12 mm	3 - 4 GHz: ≤ 12 mm 4 - 6 GHz: ≤ 10 mm
			When the x or y dimension of the test device, in the measurement plane orientation, is smaller than the above, the measurement resolution must be ≤ the corresponding x or y dimension of the test device with at least one measurement point on the test device.	
Maximum zoom scan spatial resolution: ΔX _{Zoom} , ΔY _{Zoom}			≤ 2 GHz: ≤ 8 mm 2 - 3 GHz: ≤ 5 mm*	3 - 4 GHz: ≤ 5 mm* 4 - 6 GHz: ≤ 4 mm*
Maximum zoom scan spatial resolution, normal to phantom surface	Uniform grid: ΔZ _{Zoom} (n)		≤ 5 mm	3 - 4 GHz: ≤ 4 mm 4 - 5 GHz: ≤ 3 mm 5 - 6 GHz: ≤ 2 mm
	graded grid	ΔZ _{Zoom} (1): between 1 st two points closest to phantom surface	≤ 4 mm	3 - 4 GHz: ≤ 3 mm 4 - 5 GHz: ≤ 2.5 mm 5 - 6 GHz: ≤ 2 mm
		ΔZ _{Zoom} (n>1): between subsequent points	≤ 1.5· ΔZ _{Zoom} (n-1)	
Minimum zoom scan volume	x, y, z		≥ 30 mm	3 - 4 GHz: ≥ 28 mm 4 - 5 GHz: ≥ 25 mm 5 - 6 GHz: ≥ 22 mm
Note: δ is the penetration depth of a plane-wave at normal incidence to the tissue medium: see draft standard IEEE P1528-2011 for details.				
* When zoom scan is required and the reported SAR from the area scan based 1-g SAR estimation procedures of KDB 447498 is ≤ 1.4 W/kg, ≤ 8 mm, ≤ 7 mm and ≤ 5 mm zoom scan resolution may be applied, respectively, for 2 GHz to 3 GHz, 3 GHz to 4 GHz and 4 GHz to 6 GHz				

Table 2: Parameters for SAR scan procedures.

5.4 Uncertainty Assessment

Table 3 includes the worst case uncertainty budget suggested by the IEEE 1528 [IEEE 1528-2003] and determined by Schmid & Partner Engineering AG. The expanded uncertainty (K=2) is assessed to be $\pm 21.7\%$ and is valid up to 3.0 GHz.

6 Output Power Values

6.1 Output Power Values for GPRS

This device supports GPRS Multislot class 10 and it is a class B device without DTM support. The device does not support voice mode. According the following tables, GPRS 850/1900 with 2 TX represent the worst case, therefore measurements with two active time slots are conducted for GPRS 850/1900.

Burst Averaged Output Power per Slot [dBm]				
Band	Freq. [MHz]	CH	GPRS (GMSK /CS1)	
			1TX	2 TX
850	824.2	128	32.3	32.3
	836.6	190	32.4	32.3
	848.8	251	32.4	32.4
1900	1850.2	512	30.3	30.2
	1880.0	661	29.7	29.6
	1909.8	810	29.3	29.3

Table 4: Measured output power for GPRS for the Smart Tag from buddi Limited.

Frame Averaged Output Power over 8 Slots [dBm]				
Band	Freq. [MHz]	CH	GPRS (GMSK /CS1)	
			1TX	2 TX
850	824.2	128	23.3	26.3
	836.6	190	23.4	26.3
	848.8	251	23.4	26.4
1900	1850.2	512	21.3	24.2
	1880.0	661	20.7	23.6
	1909.8	810	20.3	23.3

Table 5: Measured output power for GPRS averaged over 8 slots for the Smart Tag from buddi Limited.

6.2 Tune-Up Information

Tune-up procedure according KDB 447498 D01v05r02 is applicable. The measured SAR values are scaled according the tune-up information given by the manufacturer, shown below.

Tune-Up Information [dBm]				
Band	Freq. [MHz]	CH	Output Power	Tune-Up Limit
GPRS 850 (Class 10 / 2 TX)	824.2	128	32.3	34
	836.6	190	32.3	
	848.8	251	32.4	
GPRS 1900 (Class 10 / 2TX)	1850.2	512	30.2	31
	1880.0	661	29.6	
	1909.8	810	29.3	

Table 6: Measured output power and tune-up information for Smart Tag from buddi Limited..

6.3 SAR Test Exclusion Consideration according KDB 447498

Standalone SAR Test Exclusion Considerations for Extremity Exposure						
Communication System	Freq. [MHz]	Distance [mm]	Pavg [dBm]	Pavg [mW]	Threshold 10g Comparison Values	SAR Test Exclusion (Yes/No)
SRD 900	921	5	6.0	4	0.8	Yes
GPRS 850	835	5	34.00	2511	459	No
GPRS 1900	1880	5	31.00	1259	345	No

Table 7: SAR test exclusion for extremity exposure.

The above table shows the SAR test exclusion consideration for the applicable modes against the different device edges with the relevant distances.

The 1g and 10g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances $\leq 50\text{mm}$ are determined by:

$$[(\text{max power of channel. incl. tune-up tolerance mW})/(\text{min test separation distance. mm})]^* [\sqrt{f(\text{GHz})}]$$

≤ 7.5 for 10g extremity SAR

When the minimum test separation distance is $< 5\text{mm}$. a distance of 5mm is applied to determine SAR test exclusion.

7 SAR Results

Following KDB 447498 D01 V05, the reported SAR is the measured SAR value adjusted for maximum tune-up tolerance.

Scaling Factor = tune-up limit power (mW) / RF power (mW)

Reported SAR = measured SAR * scaling factor

Furthermore, testing of other required channels within the operating mode of frequency band is not required when the reported SAR for the mid-band or highest output power channel is ≤ 0.4 W/kg for transmission band ≥ 200 MHz.

SAR Results												
Band	Freq. [MHz]	Channel	Test Position	Spacing [mm]	Figure No.	Tune-Up Limit [dBm]	Output Power [dBm]	Measured SAR _{1g} [W/kg]	Power Drift [dBm]	Scaling Factor	Reported SAR _{10g} [W/kg]	Plot No.
GPRS 850	824.2	128	Back	0	11	34.0	32.3	0.493	0.099	1.479	0.729	1

Table 8: SAR results for GPRS Class 10 for Smart Tag from buddi Limited.

7.1 Estimated SAR for Standalone SAR Excluded Modes according KDB 447498

Since the GSM and SRD antennas can't transmit simultaneously, for SRD standard a SAR estimation based on KDB 447498 for SAR excluded modes is not applicable.

7.2 Multiple Transmitter Information

According KDB 447498, simultaneous transmission consideration for multiple transmitters needs to be addressed, if applicable. According the information given by the manufacturer, GSM and SRD can't be active at the same time.

8 Appendix

8.1 Administrative Data

Date of Validation: 835 MHz Body (GPRS850): July 04, 2014
 1900 MHz Body (GPRS1900): July 10, 2014
 Date of Measurement: July 04, 2014 - July 10, 2014

8.2 Device under Test and Test Conditions

MTE: Smart Tag from buddi Limited (production line unit)
 Date of Receipt: June 23, 2014
 IMEI: 352964058217325
 FCC ID: ZDLST1
 Equipment Class: Portable device
 RF Exposure Environment: General Population/ Uncontrolled; Extremity SAR limits
 Power Supply: Internal Battery
 Antenna: integrated
 Used Accessory: N.A.

Standard	TX Range [MHz]	RX Range [MHz]	Used Channels	Crest Factor	Phantom
GPRS 850	824.2 – 848.8	869.2 – 893.8	128, 190, 251	2.66	SAM Twin Phantom V4.0
GPRS 1900	1850.2 – 1909.8	1930.2 – 1989.8	512, 661, 810	2.66	

Table 9: Used channels and crest factors during the test.

8.3 Tissue Recipes

The following recipes are provided in percentage by weight.

835 MHz Body:	52.40 %	De-Ionized Water
	01.50 %	Salt
	45.00 %	Sugar
	00.10 %	Preventol D7
	01.00 %	Hydroxyetyl-Cellulose
1900 MHz Body:	29.68 %	Diethylenglykol-monobutylether
	70.00 %	De-Ionized Water
	0.32 %	Salt

8.4 Material Parameters

For the measurement of the following parameters the HP 85070B dielectric probe kit is used representing the open-ended coaxial probe measurement procedure. The measured values should be within $\pm 5\%$ of the recommended values given by the FCC.

Tissue Simulating Liquids			
Frequency		ϵ_r	σ [S/m]
835 MHz Body (GPRS 850)	Recommended Value	55.20 ± 2.70	0.97 ± 0.10
	Measured Value (Ch. 128)	56.40	0.94
	Measured Value (Ch. 190)	56.30	0.95
	Measured Value (Ch. 251)	56.30	0.94
1900 MHz Body (GPRS 1900)	Recommended Value	53.30 ± 2.70	1.52 ± 0.15
	Measured Value (Ch. 512)	53.70	1.47
	Measured Value (Ch. 661)	53.60	1.52
	Measured Value (Ch. 810)	53.50	1.56

Table 10: Parameters of the tissue simulating liquids.

8.5 Simplified Performance Checking

The simplified performance check was realized using the dipole validation kits. The input power of the dipole antennas were 250 mW (cw signal) and they were placed under the flat part of the SAM phantom. The target and measured results are listed in the Table 11 - 12 and shown in Figure 4 - 5. The target values were adopted from the calibration certificates which are attached in the appendix. Table 13 includes the uncertainty assessment for the system performance checking which was suggested by the [IEEE 1528-2003] and determined by Schmid & Partner Engineering AG. The expanded uncertainty (K=2) is assessed to be $\pm 16.8\%$.

Dipole Target Results					
Band	Available Dipoles		SAR_{1g} [W/kg]	ϵ_r	σ [S/m]
GPRS 850	D835V2, SN #437	Target	2.50	56.20	0.96
GPRS 1900	D1900V2, SN #5d051	Values Body	9.53	55.00	1.51

Table 11: Dipole target results as given by the calibration certificates.

Dipole Validation Results					
Band	Used Dipoles		SAR_{1g} [W/kg]	ϵ_r	σ [S/m]
GPRS 850	835 MHz, SN: 437	Measured	2.53	56.30	0.95
GPRS 1900	1900 MHz, SN:5d051	Values Body	9.41	53.60	1.55

We certify that this system is designed to be fully compliant with the standards [1 – 7] for RF emission tests of wireless devices.

The uncertainty of the measurements with this system was evaluated according to the above standards and is documented in the applicable chapters of the DASY4 system handbook.

The uncertainty values represent current state of methodology and are subject to changes. They are applicable to all laboratories using DASY4 provided the following requirements are met (responsibility of the system end user):

- 1) the system is used by an experienced engineer who follows the manual and the guidelines taught during the training provided by SPEAG,
- 2) the probe and validation dipoles have been calibrated for the relevant frequency bands and media within the requested period,
- 3) the DAE has been calibrated within the requested period,
- 4) the "minimum distance" between probe sensor and inner phantom shell and the radiation source is selected properly,
- 5) the system performance check has been successful,
- 6) the operational mode of the DUT is CW, CDMA, FDMA or TDMA (GSM, DCS, PCS, IS136, PDC) and the measurement/integration time per point is ≥ 500 ms,
- 7) if applicable, the probe modulation factor is evaluated and applied according to field level, modulation and frequency,
- 8) the dielectric parameters of the liquid are conformant with the standard requirement,
- 9) the DUT has been positioned as described in the manual.
- 10) the uncertainty values from the calibration certificates, and the laboratory and measurement equipment dependent uncertainties, are updated by end user accordingly.

Certificate of conformity / First Article Inspection

Item	SAM Twin Phantom V4.0
Type No	QD 000 P40 BA
Series No	TP-1002 and higher
Manufacturer / Origin	Untersee Composites Hauptstr. 69 CH-8559 Fruthwilen Switzerland

Tests

The series production process used allows the limitation to test of first articles.
Complete tests were made on the pre-series Type No. QD 000 P40 AA, Serial No. TP-1001 and on the series first article Type No. QD 000 P40 BA, Serial No. TP-1006. Certain parameters have been retested using further series units (called samples).

Test	Requirement	Details	Units tested
Shape	Compliance with the geometry according to the CAD model.	IT'IS CAD File (*)	First article, Samples
Material thickness	Compliant with the requirements according to the standards	2mm +/- 0.2mm in specific areas	First article, Samples
Material parameters	Dielectric parameters for required frequencies	200 MHz – 3 GHz Relative permittivity < 5 Loss tangent < 0.05.	Material sample TP 104-5
Material resistivity	The material has been tested to be compatible with the liquids defined in the standards	Liquid type HSL 1800 and others according to the standard.	Pre-series, First article

Standards

- [1] CENELEC EN 50361
- [2] IEEE P1528-200x draft 6.5
- [3] IEC PT 62209 draft 0.9
- (*) The IT'IS CAD file is derived from [2] and is also within the tolerance requirements of the shapes of [1] and [3].

Conformity

Based on the sample tests above, we certify that this item is in compliance with the uncertainty requirements of SAR measurements specified in standard [1] and draft standards [2] and [3].
