<b>Test Results</b>	Pass									
UL International (UK) Ltd. tested the above equipment in accordance with the requirements set forth in the above standards. All indications of Pass/Fail in this report are opinions expressed by UL International (UK) Ltd. based on interpretations and/or observations of test results. Measurement Uncertainties are in accordance with the above standard and are published for informational purposes only. The test results show that the equipment tested is capable of demonstrating compliance with the requirements as documented in this report.										
<b>Note:</b> The results documented in this report apply only to the tested sample(s), under the conditions and modes of operation as described herein. This document may not be altered or revised in any way unless done so by UL International (UK) Ltd. and all revisions are duly noted in the revisions section. Any alteration of this document not carried out by UL International (UK) Ltd. will constitute fraud and shall nullify the document. This report must not be used by the client to claim product certification, approval, or endorsement by UKAS. This report is written to support regulatory compliance of the applicable standards stated above.

## **2. Test Specification, Methods and Procedures**

### **2.1. Test Specification**

<b>Reference:</b>	<b>KDB Publication Number: 865664 D01 SAR Measurement 100 MHz to 6 GHz</b>
<b>Title:</b>	SAR Measurement Requirements for 100 MHz to 6 GHz
<b>Introduction:</b>	The SAR Measurement procedures for 100MHz to 6GHz are described in this document. Field probes, tissue dielectric properties, SAR scans, measurement accuracy and variability of the measured results are discussed. The field probe and SAR scan requirements are derived from criteria considered in standard IEC/IEEE 62209-1528:2020. The wireless product and technology specific procedures in applicable KDB publications are required to be used unless further guidance has been approved by the FCC.
<b>Purpose of Test:</b>	To determine if the Equipment Under Test complies with the Specific Absorption Rate for general population/uncontrolled exposure limit of 1.6 W/kg as specified in FCC 47 CFR part 2 (2.1093).

### **2.2. Methods and Procedures Reference Documentation**

The methods and procedures used were as detailed in:

#### **IEC/IEEE 62209-1528:2020**

Measurement procedure for the assessment of specific absorption rate of human exposure to radio frequency fields from hand-held and body-mounted wireless communication devices.

#### **FCC KDB Publication:**

KDB 447498 D01 General RF Exposure Guidance v06

KDB 865664 D01 SAR Measurement 100 MHz to 6 GHz v01r04

KDB 865664 D02 RF Exposure Reporting v01r02

KDB 941225 D05 SAR for LTE Devices v02r05

Note: The LTE Cat M1 and LTE NB-IOT conducted power measurements and SAR test plan was agreed with a KDB inquiry with FCC and further approval with TCB.

### **2.3. Definition of Measurement Equipment**

The measurement equipment used complied with the requirements of the standards referenced in the methods & procedures section above. Section 4.3 contains a list of the test equipment used.

### **3. Facilities and Accreditation**

The test sites and measurement facilities used to collect data are located at

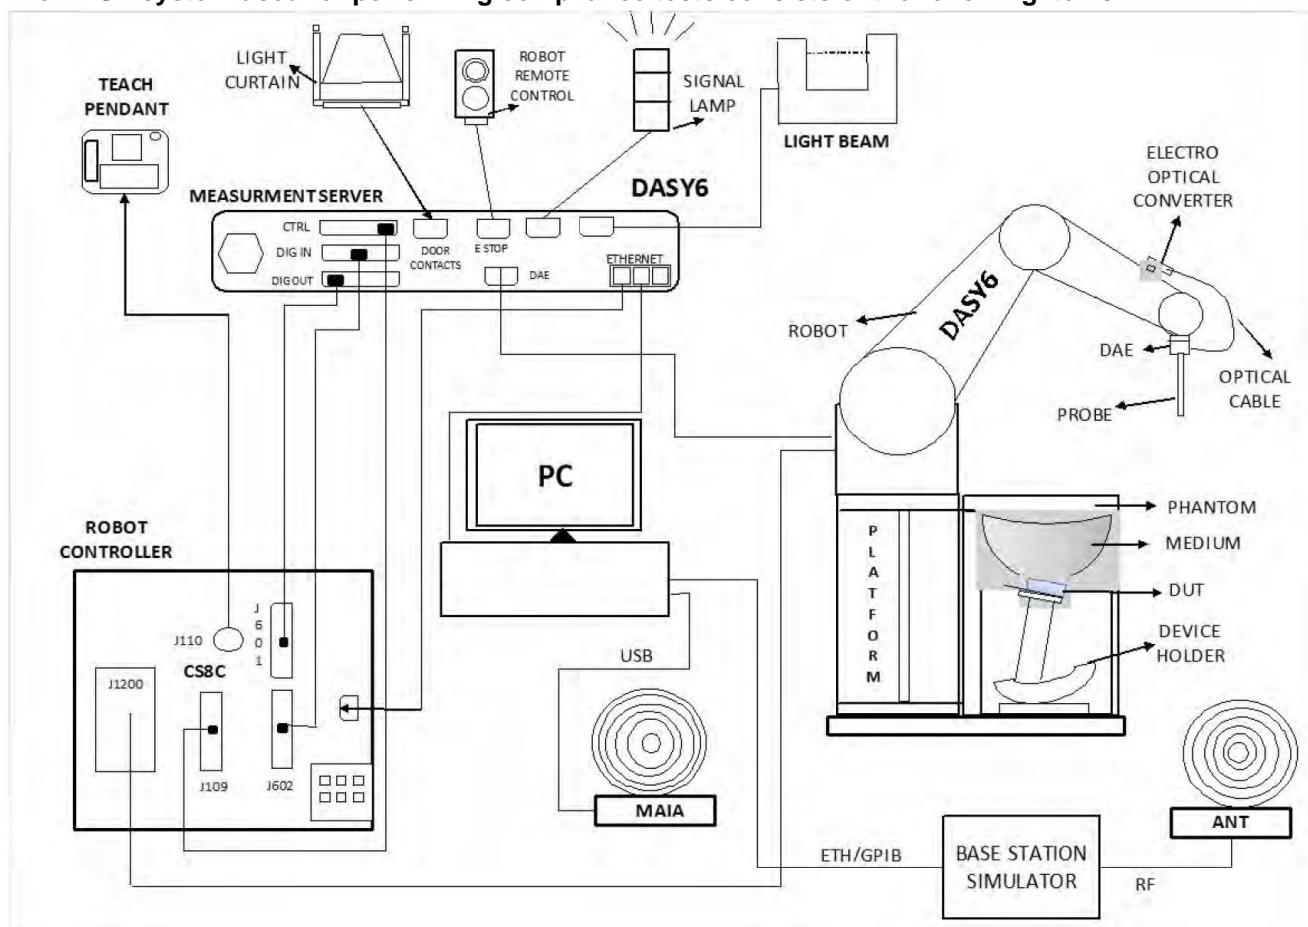

Unit 1-3 Horizon, Kingsland Business Park, Wade Road, Basingstoke, Hampshire, RG24 8AH UK	Facility Type
SAR Lab 60	Controlled Environment Chamber
SAR Lab 65	Controlled Environment Chamber

UL Verification Services Ltd, is accredited by UKAS (United Kingdom Accreditation Service), Laboratory UKAS Code 5772.

## 4. SAR Measurement System & Test Equipment

### 4.1. SAR Measurement System

The DASY system used for performing compliance tests consists of the following items:

- A standard high precision 6-axis robot with controller, teach pendant and software. An arm extension for accommodating the data acquisition electronics (DAE).
- An isotropic Field probe optimized and calibrated for the targeted measurement.
- A data acquisition electronics (DAE) which performs the signal amplification, signal multiplexing, AD-conversion, offset measurements, mechanical surface detection, collision detection, etc. The unit is battery powered with standard or rechargeable batteries. The signal is optically transmitted to the EOC.
- The Electro-optical converter (EOC) performs the conversion from optical to electrical signals for the digital communication to the DAE. To use optical surface detection, a special version of the EOC is required. The EOC signal is transmitted to the measurement server.
- The function of the measurement server is to perform the time critical tasks such as signal filtering, control of the robot operation and fast movement interrupts.
- The Light Beam used is for probe alignment. This improves the (absolute) accuracy of the probe positioning.
- A computer running Win 8.1 or Win 10 and the DASY software.
- Remote control and teach pendant as well as additional circuitry for robot safety such as warning lamps, etc.
- The phantom, the device holder and other accessories according to the targeted measurement.

## 4.2. SAR Measurement Procedure

### 4.2.1. Normal SAR Measurement Procedure

The following procedure shall be performed for each of the test conditions Measure the local SAR at a test point within 8 mm of the phantom inner surface that is closest to the DUT.

- a) Measure the two-dimensional SAR distribution within the phantom (area scan procedure).
- b) The boundary of the measurement area shall not be closer than 20 mm from the phantom side walls. The distance between the measurement points should enable the detection of the location of local maximum with an accuracy of better than half the linear dimension of the tissue cube after interpolation. A maximum grid spacing of 20 mm for frequencies below 3 GHz and  $(60/f \text{ [GHz]}) \text{ mm}$  for frequencies of 3 GHz and greater is recommended. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2 \text{ mm}$  for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. The maximum variation of the sensor-phantom surface distance shall be  $\pm 1 \text{ mm}$  for frequencies below 3 GHz and  $\pm 0,5 \text{ mm}$  for frequencies of 3 GHz and greater. At all measurement points the angle of the probe with respect to the line normal to the surface should be less than  $5^\circ$ . If this cannot be achieved for a measurement distance to the phantom inner surface shorter than the probe diameter, additional uncertainty evaluation is needed.
- c) From the scanned SAR distribution, identify the position of the maximum SAR value, in addition identify the positions of any local maxima with SAR values within 2 dB of the maximum value that will not be within the zoom scan of other peaks; additional peaks shall be measured only when the primary peak is within 2 dB of the SAR compliance limit (e.g., 1 W/kg for 1,6 W /kg 1 g limit, or 1,26 W/kg for 2 W /kg, 10 g limit).
- d) Measure the three-dimensional SAR distribution at the local maxima locations identified in step c) (zoom scan procedure). The horizontal grid step shall be  $(24 / f \text{ [GHz]}) \text{ mm}$  or less but not more than 8 mm. The minimum zoom scan size is 30 mm by 30 mm by 30 mm for frequencies below 3 GHz. For higher frequencies, the minimum zoom scan size can be reduced to 22 mm by 22 mm by 22 mm. The grid step in the vertical direction shall be  $(8-f \text{ [GHz]}) \text{ mm}$  or less but not more than 5 mm, if uniform spacing is used. If variable spacing is used in the vertical direction, the maximum spacing between the two closest measured points to the phantom shell shall be  $(12/f \text{ [GHz]}) \text{ mm}$  or less but not more than 4 mm, and the spacing between farther points shall increase by an incremental factor not exceeding 1,5. When variable spacing is used, extrapolation routines shall be tested with the same spacing as used in measurements. The maximum distance between the geometrical centre of the probe detectors and the inner surface of the phantom shall be 5 mm for frequencies below 3 GHz and  $\delta \ln(2)/2 \text{ mm}$  for frequencies of 3 GHz and greater, where  $\delta$  is the plane wave skin depth and  $\ln(x)$  is the natural logarithm. Separate grids shall be centred on each of the local SAR maxima found in step c). Uncertainties due to field distortion between the media boundary and the dielectric enclosure of the probe should also be minimized, which is achieved if the distance between the phantom surface and physical tip of the probe is larger than probe tip diameter. Other methods may utilize correction procedures for these boundary effects that enable high precision measurements closer than half the probe diameter. For all measurement points, the angle of the probe with respect to the flat phantom surface shall be less than  $5^\circ$ .
- e) Use post processing (e.g. interpolation and extrapolation) procedures to determine the local SAR values at the spatial resolution needed for mass averaging.
- f) The local SAR should be measured at the same location as in Step a). SAR drift is assessed and reported in the uncertainty budget.

In the event that the evaluation of measurement drift exceeds the 5 % tolerance, it is required that SAR be reassessed following guidelines contained within this standard.

If the drift is larger than 5 %, then the measurement drift shall be considered a bias, not an uncertainty. A correction shall be applied to the measured SAR value. It is not necessary to record the drift in the uncertainty budget (i.e.  $ui = 0\%$ ). The uncertainty budget reported in a measurement report should correspond to the highest SAR value reported (after correction, if applicable). Alternatively, the uncertainty budget reported should cover all measurements, i.e., it should report a conservative value.

**Area Scan Parameters:**

Parameter	DUT transmit frequency being tested	
	$f \leq 3 \text{ GHz}$	$3 \text{ GHz} < f \leq 10 \text{ GHz}$
Maximum distance between the measured points (geometric centre of the sensors) and the inner phantom surface ( $z_{M1}$ in Figure 20 in mm)	$5 \pm 1$	$\delta \ln(2)/2 \pm 0,5^{\text{a}}$
Maximum spacing between adjacent measured points in mm (see O.8.3.1) <sup>b</sup>	20, or half of the corresponding zoom scan length, whichever is smaller	60/f, or half of the corresponding zoom scan length, whichever is smaller
Maximum angle between the probe axis and the phantom surface normal ( $\alpha$ in Figure 20) <sup>c</sup>	5° (flat phantom only) 30° (other phantoms)	5° (flat phantom only) 20° (other phantoms)
Tolerance in the probe angle	1°	1°

<sup>a</sup>  $\delta$  is the penetration depth for a plane-wave incident normally on a planar half-space.

<sup>b</sup> See Clause O.8 on how  $\Delta x$  and  $\Delta y$  may be selected for individual area scan requirements.

<sup>c</sup> The probe angle relative to the phantom surface normal is restricted due to the degradation in the measurement accuracy in fields with steep spatial gradients. The measurement accuracy decreases with increasing probe angle and increasing frequency. This is the reason for the tighter probe angle restriction at frequencies above 3 GHz.

**Zoom Scan Parameters:**

Parameter	DUT transmit frequency being tested	
	$f \leq 3 \text{ GHz}$	$3 \text{ GHz} < f \leq 10 \text{ GHz}$
Maximum distance between the closest measured points and the phantom surface ( $z_{M1}$ in Figure 20 and Table 3, in mm)	5	$\delta \ln(2)/2^{\text{a}}$
Maximum angle between the probe axis and the phantom surface normal ( $\alpha$ in Figure 20)	5° (flat phantom only) 30° (other phantoms)	5° (flat phantom only) 20° (other phantoms)
Maximum spacing between measured points in the $x$ - and $y$ -directions ( $\Delta x$ and $\Delta y$ , in mm)	8	$24/f^{\text{b}}$
For uniform grids: Maximum spacing between measured points in the direction normal to the phantom shell ( $\Delta z_1$ in Figure 20, in mm)	5	$10/(f - 1)$
For graded grids: Maximum spacing between the two closest measured points in the direction normal to the phantom shell ( $\Delta z_1$ in Figure 20, in mm)	4	$12/f$
For graded grids: Maximum incremental increase in the spacing between measured points in the direction normal to the phantom shell ( $R_z = \Delta z_2/\Delta z_1$ in Figure 20)	1,5	1,5
Minimum edge length of the zoom scan volume in the $x$ - and $y$ -directions ( $L_z$ in O.8.3.2, in mm)	30	22
Minimum edge length of the zoom scan volume in the direction normal to the phantom shell ( $L_h$ in O.8.3.2 in mm)	30	22
Tolerance in the probe angle	1°	1°

<sup>a</sup>  $\delta$  is the penetration depth for a plane-wave incident normally on a planar half-space.

<sup>b</sup> This is the maximum spacing allowed, which might not work for all circumstances.

### 4.3. Test Equipment

Measuring equipment used to perform the tests is documented in this report and has been calibrated in accordance with UKAS' recommendations, and is traceable to recognized national standards.

#### 4.4. SAR System Specifications

<b>Robot System</b>		
<b>Positioner:</b>	Stäubli Unimation Corp. Robot Model: TX60L	
<b>Repeatability:</b>	$\pm 0.030$ mm	
<b>No. of Axis:</b>	6	
<b>Serial Number(s):</b>	F14/5UA6A1/A/01 F17/5ENYG1/A/01	
<b>Reach:</b>	920 mm	
<b>Payload:</b>	2.0 kg	
<b>Control Unit:</b>	CS8C	
<b>Programming Language:</b>	V+	
<b>Data Acquisition Electronic (DAE) System</b>		
<b>Serial Number:</b>	DAE4 SN: 1435, 1438	
<b>PC Controller</b>		
<b>PC:</b>	HP EliteDesk800	
<b>Operating System:</b>	Windows 10	
<b>Data Card:</b>	DASY Measurement Servers	
<b>Data Controller</b>		
<b>Features:</b>	Signal Amplifier, multiplexer, A/D converted and control logic.	
<b>Software:</b>	cDASY6 Software	
<b>Connecting Lines:</b>	Optical downlink for data and status info. Optical uplink for commands and clock.	
<b>PC Interface Card</b>		
<b>Function:</b>	24 bit (64 MHz) DSP for real time processing Link to DAE4 16 bit A/D converter for surface detection system serial link to robot direct emergency stop output for robot.	
<b>Phantom</b>		
<b>Phantom:</b>	SAM Phantom	ELI Phantom
<b>Shell Material:</b>	Fibreglass	Fibreglass
<b>Thickness:</b>	$2.0 \pm 0.1$ mm	$2.0 \pm 0.1$ mm

<b>E-Field Probe</b>		
<b>Model:</b>	EX3DV4	ES3DV3
<b>Serial No:</b>	7495, 7496	3358
<b>Construction:</b>	Triangular core	Triangular core
<b>Frequency:</b>	10MHz to >6GHz	10MHz to >4GHz
<b>Linearity:</b>	±0.2 dB (30 MHz to 6 GHz)	±0.2 dB (30 MHz to 4 GHz)
<b>Probe Length (mm):</b>	337	337
<b>Probe Diameter (mm):</b>	10	10
<b>Tip Length (mm):</b>	9	10
<b>Tip Diameter (mm):</b>	2.5	4
<b>Sensor X Offset (mm):</b>	1	2
<b>Sensor Y Offset (mm):</b>	1	2
<b>Sensor Z Offset (mm):</b>	1	2

## **5. Measurement Uncertainty**

No measurement or test can ever be perfect and the imperfections give rise to error of measurement in the results. Consequently, the result of a measurement is only an approximation to the value of the measurand (the specific quantity subject to measurement) and is only complete when accompanied by a statement of the uncertainty of the approximation.

The expression of uncertainty of a measurement result allows realistic comparison of results with reference values and limits given in specifications and standards.

The uncertainty of the result may need to be taken into account when interpreting the measurement results.

The reported expanded uncertainties below are based on a standard uncertainty multiplied by an appropriate coverage factor, such that a confidence level of approximately 95% is maintained. For the purposes of this document "approximately" is interpreted as meaning "effectively" or "for most practical purposes".

Test Name	Confidence Level	Calculated Uncertainty
Uncertainty- 300 MHz < Freq. < 3 GHz Body Configuration 1 g	95 %	±25.42 %
Uncertainty- 300 MHz < Freq. < 3 GHz Body Configuration 10 g	95%	±25.33 %

The methods used to calculate the above uncertainties are in line with those recommended within the various measurement specifications. Where measurement specifications do not include guidelines for the evaluation of measurement uncertainty, the published guidance of the appropriate accreditation body is followed.

## 5.1. Uncertainty – 300 MHz < Freq. < 3 GHz Body Configuration 1g

Type	Source of uncertainty	+ Value	- Value	Probability Distribution	Divisor	$c_i(1g)$	Standard Uncertainty		$v_i$ or $v_{eff}$
							+ u (%)	- u (%)	
B	Probe calibration	12.000	12.000	normal (k=2)	2.0000	1.0000	6.000	6.000	$\infty$
B	Probe calibration drift	1.700	1.700	Rectangular	1.7321	1.0000	0.981	0.981	$\infty$
B	Probe Linearity and Detection Limits	4.700	4.700	Rectangular	1.7321	1.0000	2.714	2.714	$\infty$
B	Broadband Signal	3.000	3.000	Rectangular	1.7321	1.0000	1.732	1.732	$\infty$
B	Probe Isotropy	7.600	7.600	Rectangular	1.7321	1.0000	4.388	4.388	$\infty$
B	Data Acquisition	0.300	0.300	normal (k=1)	1.0000	1.0000	0.300	0.300	$\infty$
B	RF Ambient conditions	0.260	0.260	normal (k=1)	1.0000	1.0000	0.260	0.260	$\infty$
B	Probe Positioning	0.700	0.700	normal (k=1)	1.0000	0.1400	0.098	0.098	$\infty$

## **6. Device Under Test (DUT) Information**

### **6.1. DUT Description**

<b>DUT Description:</b>	The EUT is an e-Bike motion sensor and communication module used for data communication in the event of a detected theft or accident. The EUT had GPS reception and communication capabilities over LTE Cat-M1 and NB-IoT.		
<b>Validator Serial Number:</b>	14026-0002-01-368-00-0000	SAR Evaluation CAT-M1	
	14026-0014-01-368-00-0000	SAR Evaluation NB2-IOT	
	14026-0021-01-368-00-0000	Conducted Power Measurements CAT-M1	
	14025-0001-01-368-00-0000	Conducted Power Measurements NB2-IOT	
<b>Hardware Part Number:</b>	EB13 100 00B		
<b>Hardware Version Number:</b>	7.0.0		
<b>Software Version Number:</b>	0.13.1-pi21-07-4		
<b>Country of Manufacture:</b>	China		
<b>Device dimension</b>	Overall (Height x Width x Depth): 87.1 mm x 35.2 mm x 23 mm		
<b>Date of Receipt:</b>	21 September 2021		
<b>Antenna Type:</b>	Internal Integral		
<b>Antenna Length:</b>	As specified in Appendix 12.1		
<b>Number of Antenna Positions:</b>	Main Antenna – Tx – Cellular		1 fixed
	GNSS Antenna – Rx		1 fixed
<b>Battery Type(s):</b>	External DC Power Supply 13.5 (V), 0.3 (A) Internal Built-In Lithium polymer 3.8 (V), 650 (mAh)		

### **6.2. Wireless Technologies**

Wireless technologies	Frequency bands	Operating mode	Duty Cycle
LTE – CAT – M1 <input checked="" type="checkbox"/> (HD-FDD) Power Class 5	Band 2 Band 4 Band 5 Band 12 Band 13	QPSK 16QAM	30.1% (HD-FDD)
Does this device SV-LTE (1xRTT-LTE)? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No			
LTE – NB2 – IOT <input checked="" type="checkbox"/> (HD-FDD) Power Class 5	Band 2 Band 4 Band 5 Band 12 Band 13	BPSK ( $\pi/2$ ) QPSK QPSK ( $\pi/4$ )	42.0% (HD-FDD)
Does this device SV-LTE (1xRTT-LTE)? <input type="checkbox"/> Yes <input checked="" type="checkbox"/> No			

**Additional Information Related to Testing:**

### 6.3. Nominal and Maximum Output power

RF Air interface	Mode	Target + Max. Tolerances (dBm)
LTE CAT-M1 Band 2	QPSK (1RB)	22.70
	QPSK (50% RB)	22.70
	QPSK(100% RB)	22.70
	16-QAM (1RB)	22.70
	16-QAM (50% RB)	22.70
	16-QAM (100% RB)	22.70
LTE CAT-M1 Band 4	QPSK (1RB)	22.70
	QPSK (50% RB)	22.70
	QPSK(100% RB)	22.70
	16-QAM (1RB)	22.70
	16-QAM (50% RB)	22.70
	16-QAM (100% RB)	22.70
LTE CAT-M1 Band 5	QPSK (1RB)	22.70
	QPSK (50% RB)	22.70
	QPSK(100% RB)	22.70
	16-QAM (1RB)	22.70
	16-QAM (50% RB)	22.70
	16-QAM (100% RB)	22.70
LTE CAT-M1 Band 12	QPSK (1RB)	22.70
	QPSK (50% RB)	22.70
	QPSK(100% RB)	22.70
	16-QAM (1RB)	22.70
	16-QAM (50% RB)	22.70
	16-QAM (100% RB)	22.70
LTE CAT-M1 Band 13	QPSK (1RB)	22.70
	QPSK (50% RB)	22.70
	QPSK(100% RB)	22.70
	16-QAM (1RB)	22.70
	16-QAM (50% RB)	22.70
	16-QAM (100% RB)	22.70

**Note:**

1. The nominal and maximum average source based rated powers declared and supplied by manufacturer are shown in the above tables and including of the Upper Tolerance.
2. These are specified maximum allowed average power for all the wireless modes and frequency bands supported.
3. MPR implemented in applicable LTE-CAT-M1 cases according to Table 6.2.3EA-2 of 3GPP TS 136-521-1 V14.5.0

RF Air interface	Mode	Target + Max. Tolerances (dBm)
LTE NB2-IOT Band 2	BPSK ( $\pi/2$ )	22.70
	QPSK ( $\pi/4$ )	22.70
	QPSK	22.70
LTE NB2-IOT Band 4	BPSK ( $\pi/2$ )	22.70
	QPSK ( $\pi/4$ )	22.70
	QPSK	22.70
LTE NB2-IOT Band 5	BPSK ( $\pi/2$ )	22.70
	QPSK ( $\pi/4$ )	22.70
	QPSK	22.70
LTE NB2-IOT Band 12	BPSK ( $\pi/2$ )	22.70
	QPSK ( $\pi/4$ )	22.70
	QPSK	22.70
LTE NB2-IOT Band 13	BPSK ( $\pi/2$ )	22.70
	QPSK ( $\pi/4$ )	22.70
	QPSK	22.70

**Note:**

1. The nominal and maximum average source based rated powers declared and supplied by manufacturer are shown in the above tables and including of the Upper Tolerance.
2. These are specified maximum allowed average power for all the wireless modes and frequency bands supported.
3. MPR implemented in applicable LTE-NB2-IOT cases according to Table 6.2.3F.3-1 of 3GPP TS 136-521-1 V15.5.0

## 7. RF Exposure Conditions (Test Configurations)

### 7.1. Configuration Consideration

Technology Antenna	Configuration	Antenna-to-User Separation	Position	Antenna-to-Edge Separation (mm)	Evaluation Considered	
~ Cellular Antenna ~ CAT-M1/NB2 Antenna	Body-Worn	0mm	Front	<25mm	Yes	
			Front (Tilt)	<25mm	Yes	
			Back	<25mm	Yes	
			Edge 1 (Top Edge)	<25mm	Yes	
			Edge 2 (Right Edge)	<25mm	Yes	
			Edge 3 (Bottom Edge)	>25mm	No	
			Edge 4 (Left Edge)	<25mm	Yes	
			Front	<25mm	Yes	
	Extremity		Front (Tilt)	<25mm	Yes	
			Back	<25mm	Yes	
			Edge 1 (Top Edge)	<25mm	Yes	
			Edge 2 (Right Edge)	<25mm	Yes	
			Edge 3 (Bottom Edge)	>25mm	No	
			Edge 4 (Left Edge)	<25mm	Yes	

**Note:**

1. The Antenna to edge separation distances are indicated in the 'Antenna Schematics' located in Section 12.1 of this report.
2. It was found that a small separation distance between the phantom and DUT (at the location of antenna) was made by positioning the DUT flat to the phantom on the Front configuration. Thus in addition to the Front position "Front (Tilt)" was evaluated by positioning the device by giving a slight tilted angle to reduce the separation distance at the location of the antenna.
3. As per FCC KDB inquiry, spot check runs were performed on the worst case edges from the 0mm body worn and extremity testing at a 2mm separation distance whilst the DUT is attached to the drive unit without the design cover on. This setup reflects the intended use case where the design cover is declared to have a minimum thickness off 2mm.
4. Labelled diagram of the tested edges is located in Section 12.1 of this report.
5. In order to test the RF performance of the DUT on its internal battery, the overall worst case was tested with the DC power supply disconnected.

### 7.2. SAR Test Exclusion Consideration

Frequency Band	Configuration(s)	
	Body-Worn	Extremity
	Cellular Antenna	
LTE CAT-M1 Band 2	No	No
LTE CAT-M1 Band 4	No	No
LTE CAT-M1 Band 5	No	No
LTE CAT-M1 Band 12	No	No
LTE CAT-M1 Band 13	No	No
LTE NB2-IOT Band 2	No	No
LTE NB2-IOT Band 4	No	No
LTE NB2-IOT Band 5	No	No
LTE NB2-IOT Band 12	No	No
LTE NB2-IOT Band 13	No	No

**Note:**

1. As per KDB publication 447498 D01, the frequency bands with rated power including upper tolerance, which qualify for Standalone Test Exclusion, are as per the above table.
2. The details for the Maximum Rated Power and tolerance(s) can be found in section 6.

## **8. Conducted Output Power Measurements**

### **8.1. RF Output Average Power Measurement: LTE – CAT – M1 (Body-Worn & Extremity)**

#### **8.1.1. LTE CAT-M1 Band 2**

Ch.BW (MHz)	Config	Mode	Channel	Frequency (MHz)	Measured Avg Power (dBm) nRB @ RB#, NBI

## **9. Dielectric Property Measurements & System Check**

### **9.1.Tissue Dielectric Parameters**

The temperature of the tissue-equivalent medium used during measurement must also be within 18°C to 25°C and within  $\pm 2^\circ\text{C}$  of the temperature when the tissue parameters are characterized.

The dielectric parameters must be measured before the tissue-equivalent medium is used in a series of SAR measurements. The parameters should be re-measured after each 3 – 4 days of use; or earlier if the dielectric parameters can become out of tolerance; for example, when the parameters are marginal at the beginning of the measurement series.

Tissue dielectric parameters were measured at the low, middle and high frequency of each operating frequency range of the test device.

#### **IEC/IEEE 62209-1528:2020**

Target Frequency (MHz)	Head

9000	31.60	9.08
9500	31.00	9.71
10000	30.40	10.40

**NOTE:** For convenience, permittivity and conductivity values at some frequencies that are not part of the original data from Drossos et al. [B60] or the extension to 5800 MHz are provided (i.e., the values shown in italics). These values were linearly interpolated between the values in this table that are immediately above and below these values, except the values at 6000 MHz that were linearly extrapolated from the values at 3000 MHz and 5800 MHz.

## 9.2. System Check

SAR system verification is required to confirm measurement accuracy, according to the tissue dielectric media, probe calibration points and other system operating parameters required for measuring the SAR of a test device. The system verification must be performed for each frequency band and within the valid range of each probe calibration point required for testing the device. The same SAR probe(s) and tissue-equivalent media combinations used with each specific SAR system for system verification must be used for device testing. When multiple probe calibration points are required to cover substantially large transmission bands, independent system verifications are required for each probe calibration point. A system verification must be performed before each series of SAR measurements using the same probe calibration point and tissue-equivalent medium. Additional system verification should be considered according to the conditions of the tissue-equivalent medium and measured tissue dielectric parameters, typically every three to four days when the liquid parameters are re-measured or sooner when marginal liquid parameters are used at the beginning of a series of measurements.

## 9.3. Reference Target SAR Values

The reference SAR values are obtained from the calibration certificate of system validation dipoles. The measured values are normalised to 1 Watt.

System Dipole	Serial No.	Cal. Date	Freq. (MHz)	Numerical Target SAR Values (mW/g)

## 9.4. Dielectric Property Measurements & System Check Results

The 1-g SAR and 10-g SAR measured with a reference dipole, using the required tissue-equivalent medium at the test frequency, must be within  $\pm 10\%$  of the manufacturer calibrated dipole SAR target. The internal limit is set to  $\pm 10\%$ .

## **10. Measurements, Examinations and Derived Results**

### **10.1. Specific Absorption Rate - Test Results – CAT – M1 – Body-Worn**

In order to determine the highest value of the peak spatial-average SAR, all required device positions, configurations and operating modes were tested per each frequency band. SAR measurement was performed on the highest output channel, and overall worst case configurations was tested on remaining channels,

In case the reported SAR levels were higher than half of the SAR limit, remaining channels on that particular test position were also evaluated.

Note: Refer to section 7 for the configuration considered for SAR test.

3. Overall worst case has been repeated with the DUT attached to the drive unit at a 2mm separation distance.

### 10.3. Specific Absorption Rate - Test Results – NB2 – IOT – Body-Worn

In order to determine the highest value of the peak spatial-average SAR, all required device positions, configurations and operating modes were tested per each frequency band. SAR measurement was performed on the highest output channel, and overall worst case configurations was tested on remaining channels,

In case the reported SAR levels were higher than half of the SAR limit, remaining channels on that particular test position were also evaluated.

Note: Refer to section 7 for the configuration considered for SAR test.

**Note(s):**

1. Overall worst case has been repeated with the DC power supply disconnected.
2. Multitone 6 & 12 RB allocation was tested as the Reported SAR is  $\geq 0.8$  W/kg.
3. Overall worst case has been repeated with the DUT attached to the drive unit at a 2mm separation distance.

## 10.4. Specific Absorption Rate - Test Results – NB2 – IOT - Extremity

In order to determine the highest value of the peak spatial-average SAR, all required device positions, configurations and operating modes were tested per each frequency band. SAR measurement was performed on the highest output channel, and overall worst case configurations was tested on remaining channels,

In case the reported SAR levels were higher than half of the SAR limit, remaining channels on that particular test position were also evaluated.

Note: Refer to section 7 for the configuration considered for SAR test.

2. Overall worst case has been repeated with the DUT attached to the drive unit at a 2mm separation distance.

## 10.5.SAR Measurement Variability

In accordance with published RF Exposure KDB procedure 865664 D01 SAR measurement 100 MHz to 6 GHz. These additional measurements are repeated after the completion of all measurements requiring the same head or body tissue-equivalent medium in a frequency band. The test device should be returned to ambient conditions (normal room temperature) with the battery fully charged before it is re-mounted on the device holder for the repeated measurement(s) to minimize any unexpected variations in the repeated results.

### 1g-SAR (Body-Worn)

- 1) Repeated measurement is not required when the original highest measured SAR is < 0.8 W/Kg; steps 2) through 4) do not apply.
- 2) When the original highest measured 1g-SAR is  $\geq 0.80$  W/Kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 1.45$  W/kg (~ 10% from the 1g-SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 1.50$  W/Kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

### Repeat Measurements Results

Note: All the 1g measured SAR fall in above criteria, repeat runs were performed and included in the test results table in section 10.

### 10g-SAR (Extremity)

- 1) Repeated measurement is not required when the original highest measured SAR is < 2.0 W/Kg; steps 2) through 4) do not apply.
- 2) When the original highest measured 10g-SAR is  $\geq 2.00$  W/Kg, repeat that measurement once.
- 3) Perform a second repeated measurement only if the ratio of largest to smallest SAR for the original and first repeated measurements is  $> 1.20$  or when the original or repeated measurement is  $\geq 3.625$  W/kg (~ 10% from the 10g-SAR limit).
- 4) Perform a third repeated measurement only if the original, first or second repeated measurement is  $\geq 3.75$  W/Kg and the ratio of largest to smallest SAR for the original, first and second repeated measurements is  $> 1.20$ .

### Repeat Measurements Results

Note: Since the 10g measured SAR for none of the runs was  $> 2.0$  W/Kg, repeat measurements were not performed on Extremity.

## **11. Highest Standalone SAR**

### **11.1. Highest Standalone Reported SAR**

#### **Individual Transmitter Evaluation per Band:**

Exposure Configuration	Technology Band	Reported 10g - SAR (W/Kg)	Equipment Class	Highest Reported 10g-SAR (W/Kg)
Body-Worn (Separation Distance 0mm)	LTE CAT – M1 Band 2	1.05	PCE	1.45
	LTE CAT – M1 Band 4	0.90		
	LTE CAT – M1 Band 5	0.70		
	LTE CAT – M1 Band 12	0.38		
	LTE CAT – M1 Band 13	0.50		
	LTE NB2 – IOT - Band 2	1.24		
	LTE NB2 – IOT - Band 4	1.45		
	LTE NB2 – IOT - Band 5	0.83		
	LTE NB2 – IOT - Band 12	0.28		
	LTE NB2 – IOT - Band 13	0.58		

Exposure Configuration	Technology Band	Reported 10g - SAR (W/Kg)	Equipment Class	Highest Reported 10g-SAR (W/Kg)
Extremity (Separation Distance 0mm)	LTE CAT – M1 Band 2	0.53	PCE	0.62
	LTE CAT – M1 Band 4	0.40		
	LTE CAT – M1 Band 5	0.39		
	LTE CAT – M1 Band 12	0.25		
	LTE CAT – M1 Band 13	0.31		
	LTE NB2 – IOT - Band 2	0.62		
	LTE NB2 – IOT - Band 4	0.60		
	LTE NB2 – IOT - Band 5	0.44		
	LTE NB2 – IOT - Band 12	0.18		
	LTE NB2 – IOT - Band 13	0.37		

## 11.2. Simultaneous Transmission analysis

Simultaneous transmission SAR test analysis is determined for each operating configuration and exposure condition according to the reported standalone SAR of each applicable simultaneous transmitting antenna.

The worst case simultaneous transmission analysis is considered for the following cases:

Note: As none of transmitting antenna can simultaneously transmit, no simultaneous transmission analysis is required.
