RE: FCC ID: O3L-PT2005-MF_ATCB003419

Attention: Sam Chien

1. Please note that the test procedure on page 9 of the FCC test report states that the receive antenna was raised and lowered 1-4 meters. Please note that this is a requirement for frequencies above 30MHz where a broadband antenna is usually used and is not a requirement for loop antenna measurements below 30MHz. It is only necessary to change the axis of the loop antenna. Please explain.

Ans: Sorry!! We don't detailed description how to testing with loop antenna in report. Actually loop antenna at fixed 1m height with plane vertical and rotated about its vertical axis for maximum response. Then change to plane horizontal and record the spectrum level.

2. Please note that while a magnetic loop antenna is listed in the test instrumentation, the test procedures for the fundamental do not indicate what type antenna was used. Please confirm that a magnetic loop antenna was used to measure all frequencies below 30MHz.

Ans: Please see page 9 and 14 of "FCC report-revised".
