

# ConnectCore® 6UL

## System-on-module solution

---

Hardware Reference Manual

## Revision history—90001523

Revision	Date	Description
1P	May 2016	Preliminary document
2P	May 2016	Add reflow profiles
3P	June 2016	Revise bootstrap-GPIO configuration table; add new power supply architecture graphics; revise MCA pinout table
4P	August 2016	Revise pinout table, add new and revise graphics, update official weight, list Bluetooth 4.2, incorporate miscellaneous editorial corrections, remove "preliminary" designation
A	March 2017	Add power consumption, MCA, wireless interfaces, socket, assembly and product soldering, cryptoauthentication, bootstrap, and electrical characteristics sections; modify pinout tables; miscellaneous editorial revisions.

## About the ConnectCore® 6UL

---

The ConnectCore 6UL module delivers a secure and extremely cost-effective connected System-on-Module platform that is slightly bigger than a postage stamp. Its innovative Digi SMTplus™ (patent-pending) surface mount form factor allows you to choose simplified design integration leveraging proven and easy-to-use edge-castellated SMT technology, or a versatile LGA option for ultimate design flexibility with access to virtually all interfaces.

Built on the NXP i.MX6UL application processor, the module is the intelligent communication engine for today's secure connected devices. It seamlessly integrates dual-Ethernet and pre-certified dual-band Wi-Fi (802.11a/b/g/n/ac) with Bluetooth 4.2 dual mode connectivity.

## Features and functionality

The ConnectCore 6UL system-on-module is based on the i.MX6UL processor from NXP. This processor offers a number of interfaces, most of them multiplexed and not available simultaneously. The module has the following features:

- i.MX6UL single ARM Cortex-A7 core operating at speeds up to 528 MHz:
  - 32 Kb L1 instruction cache
  - 32 Kb L1 data cache
  - Up to 128 KB unified instruction/data L2 cache
  - NEON MPE (media processing engine) co-processor
- Up to 1 GB, 16-bit DDR3-800 memory
- Up to 2 GB, 8-bit SLC NAND flash memory
- NXP PF3000 power management IC (PMIC):
  - x 4 DC/DC buck converters
  - x 6 LDO regulators
  - x 1 DC/DC boost converter
  - OTP (one-time programmable) memory
  - Coin cell charger and always-ON RTC supply
- Graphical hardware accelerators:
  - PXP (PiXel Processing Pipeline)
  - ASRC (asynchronous sample rate converter)
- Secure Element
- Security accelerators:

- ARM TrustZone
- CAAM (cryptographic acceleration and assurance module)
- SNVS (secure non-volatile storage)
- CSU (central security unit)
- A-HABv4 (advanced high-assurance boot)
- IEEE 802.11 a/b/g/n/ac WLAN interface
- Bluetooth version 4.2 dual-mode
- ARM Cortex-M0+ Micro Controller Assist™ (MCA) subsystem
- Debug interfaces:
  - System JTAG controller
  - Single Wired Debug (SWD) interface for the MCA
- Support of i.MX6UL interfaces:
  - 16-bit data/address bus
  - Display: 24-bit parallel bus
  - Camera: 24-bit parallel bus
  - KPP (key pad port)
  - TSC (touch screen controller)
  - x 2 MMC/SD/SDIO card ports
  - x 2 USB 2.0 OTG with integrated HS USB PHYs
  - x 2 10/100 Mbps Ethernet MAC
  - UART, SPI, I2C, PWM, ADC, CAN, I2S, and GPIOs
- Ultra-miniature SMT module (29 x 29 x 3.5 mm) based on 245 pads (245 LGA, 76 also available as castellated pads)

## ConnectCore 6UL module variants

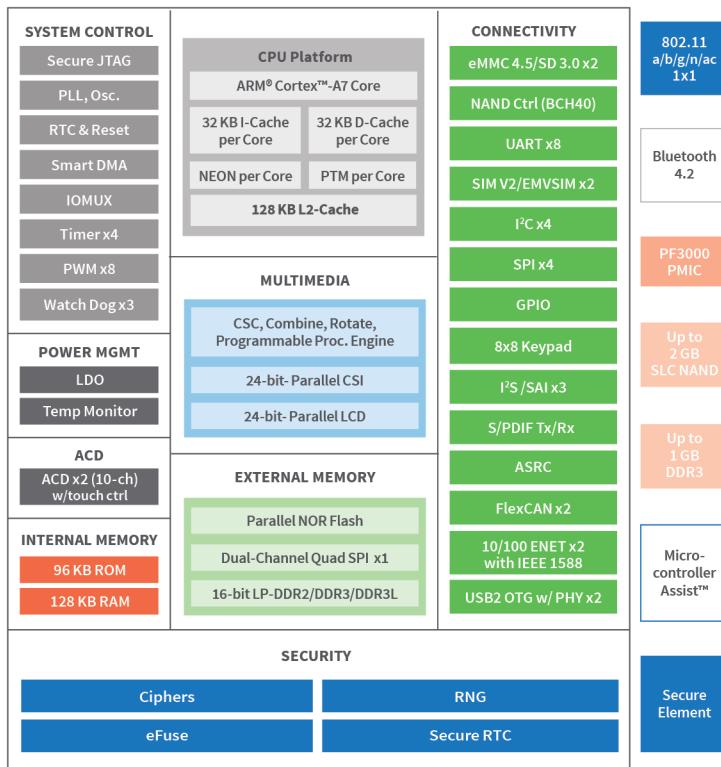

Smart part number	Part number	ConnectCore 6UL SOM variant	Description	CPU <sup>1</sup>	DDR3/Bus-width <sup>2</sup>	WiFi/Bluetooth
CC-WMX-JN58-NE	50001939-01	0x02	ConnectCore for i.MX6UL-2, 528 MHz, Industrial Temp, 256 MB SLC NAND, 256 MB DDR3, Dual 10/100 Ethernet, 802.11a/b/g/n/ac, Bluetooth 4.1, ANT+	G2CVK05 - 40/+105°C 528 MHz	256MiB (1x2Gbit) / 16bit, -40/+95°C	
CC-MX-JN58-Z1	50001939-02	0x03	ConnectCore for i.MX6UL-2, 528 MHz, Industrial Temp, 256 MB SLC NAND, 256 MB DDR3, Dual 10/100 Ethernet	G2CVK05 - 40/+105°C 528 MHz	256MiB (1x2Gbit) / 16bit, -40/+95°C	

<sup>1</sup> CPU temperature is T<sub>j</sub> (junction)  
<sup>2</sup> DDR3 temperature is T<sub>a</sub> (ambient)

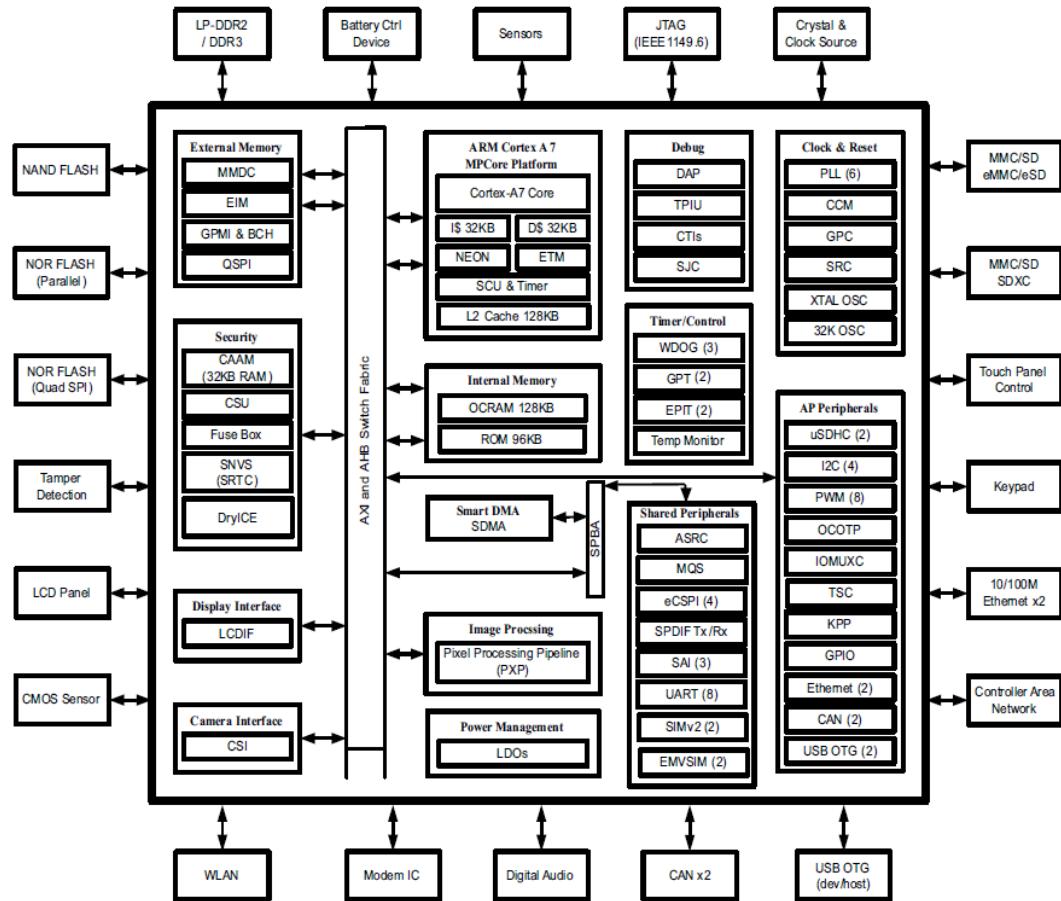

## Block diagrams

The figures below show block diagrams of the ConnectCore 6UL module and of the NXP i.MX6UL application processor.

## ConnectCore 6UL module

## NXP i.MX6UL application processor

## Power supply

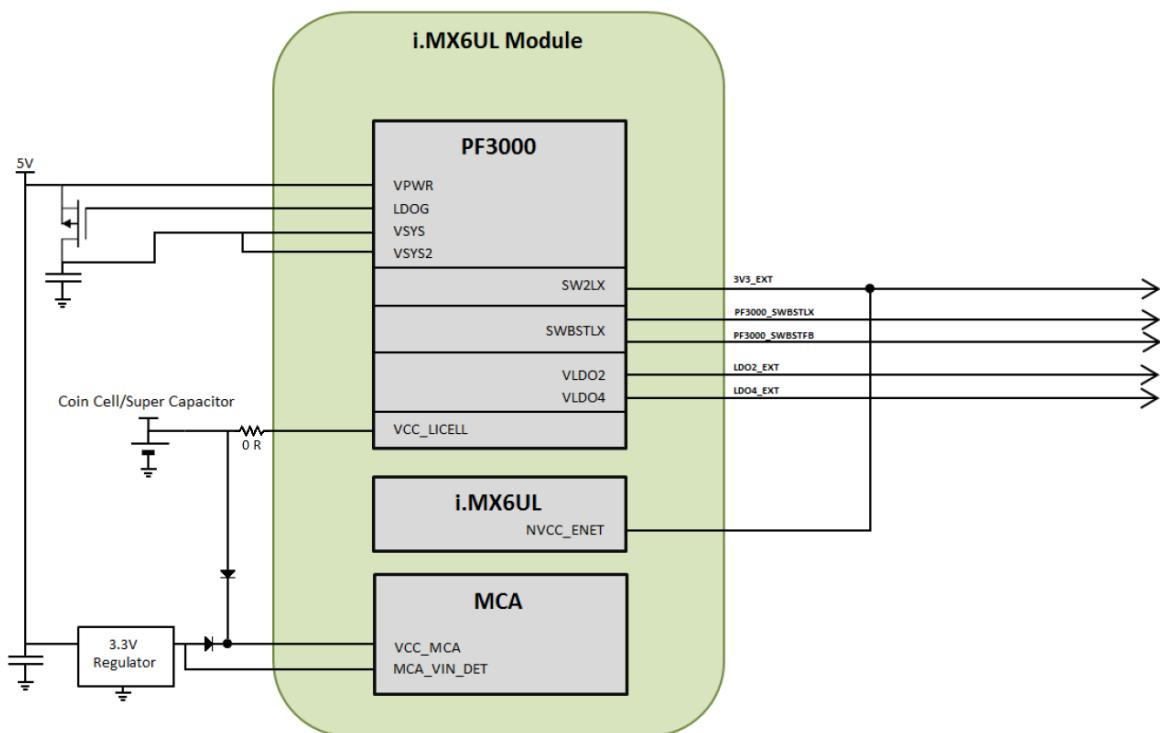

### Power supply architecture

The ConnectCore 6UL requires a primary power supply input. This supply is the main power domain to the on-module NXP PF3000 power management IC (PMIC), which generates all required supply voltages for the module as well as the external interfaces. The system can be powered from voltages up to 5.5V. See [Powering the system from a nominal 5V power supply \(4.5V to 5.5V\)](#) and [Powering the system for battery-powered applications \(3.7V - 4.5V\)](#) for recommended power schemes for the ConnectCore 6UL module.

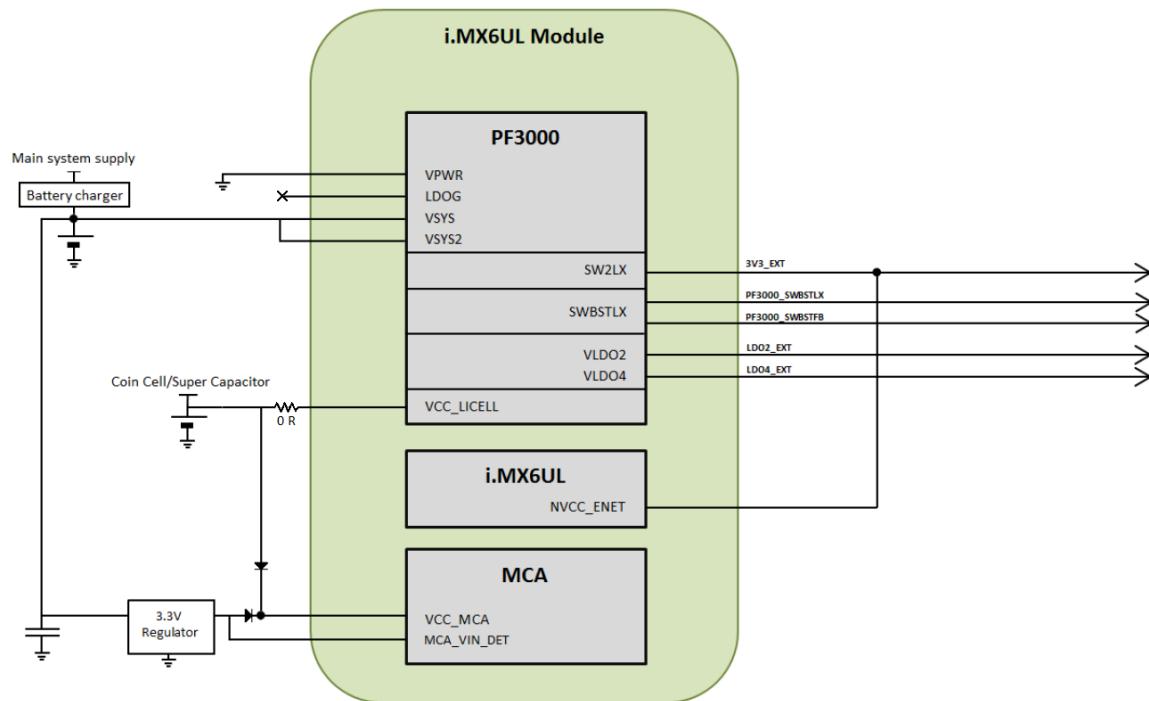

The ConnectCore 6UL module has a dedicated pin for connecting a coin cell backup battery or super capacitor. You can enable a coin cell charger on the PMIC with Li-ion rechargeable batteries. This backup battery or super capacitor is mandatory if RTC time must persist after the module has been disconnected from main power. You must also follow the recommended diode configuration as shown in the diagrams below to make sure the module holds the system time.

If RTC time retention is not required, you can remove the circuitry from your design and connect the 3.3V voltage regulator directly to the VCC\_MCA and MCA\_VIN\_DET pins.

### ***Powering the system from a nominal 5V power supply (4.5V to 5.5V)***

### Powering the system for battery-powered applications (3.7V - 4.5V)

**Note** In the implementations shown above, the coin cell/supercapacitor is connected to VCC\_LICELL pin of the ConnectCore 6UL module, allowing coin-cell charger applications. This VCC\_LICELL connection feeds the VSNVS regulator of the PMIC, which supplies the SNVS power domain of the CPU. This power domain allows some functionality of the CPU in low power mode applications when the main power supply of the system is removed. However, this connection significantly increases the power consumption of the coin cell/supercapacitor in this low-power mode.

#### To optimize power management in coin cell applications:

Do not connect the coin cell/supercapacitor to the VCC\_LICELL power domain (keep the connection to VCC\_MCA). This removes coin-cell charger functionality but drastically reduces power consumption and extends the life of the power supply. However, this connection significantly increases the power consumption of the coin cell/supercapacitor in this low-power mode to around 350  $\mu$ A.

The power architecture of the module is described in more detail below.

The PMIC generates the following power domains that are available on the module pads:

- Buck converters. Two buck regulators provide 3.3V:
  - SW1A: 3V3\_INT, powers several interfaces inside the module
  - SW2: 3V3\_EXT, free power line not used inside the module
- And another two buck regulators used for internal supply:
  - SW1B: VDD\_ARM\_SOC\_IN
  - SW3: VCC\_DDR3

Power domain	Regulator type	Output accuracy	Maximum current	Dropout voltage (MAX)	Turn on time (MAX)	Turn off time (MAX)	Quiescent current in OFF mode (TYP)
SW1A	DC/DC	+/-6.0 %	1.00 A	-	500 us	-	-
SW2	DC/DC	+/-6.0 %	1.25 A	-	500 us	-	-
SW1B	DC/DC	+/-6.0 %	1.75 A	-	500 us	-	-
SW3	DC/DC	+/-6.0 %	1.5 A	-	500 us	-	-

**Note** Maximum current includes both the module and the module carrier board consumption.  
 SW1: parameters specified at TA=-40 °C to 85 °C, VIN=VSW1xIN=3.6V, VSW1x=1.2 V, ISW1x=100 mA.  
 SW2: parameters specified at TA=-40 °C to 85 °C, VIN=VSW2IN=3.6V, VSW2=3.15 V, ISW2=100 mA.  
 SW3: parameters specified at TA=-40 °C to 85 °C, VIN=VSW3IN=3.6V, VSW3=1.5 V, ISW3=100 mA.

- LDO regulators. Four PMIC regulators are available; the module uses LDO1: VDDA\_ADC\_3P3.

LDO	Regulator type	Output accuracy	Maximum current	Dropout voltage (MAX)	Turn on time (MAX)	Turn off time (MAX)	Quiescent current in OFF mode (TYP)
VLDO1	1.8-3.3V	+/-3.0 %	0.100 A	60 mV	500 us	10 ms	13 uA
VLDO2	0.8-1.55V	+/-3.0 %	0.250 A	60 mV	500 us	10 ms	13 uA
VLDO3	1.8-3.3V	+/-3.0 %	0.100 A	60 mV	500 us	10 ms	13 uA
VLDO4	1.8-3.3V	+/-3.0 %	0.350 A	60 mV	500 us	10 ms	13 uA

**Note** Maximum current includes both the module and the module carrier board consumption.  
 VLDO1 parameters specified at TA=-40 °C to 85 °C, VIN=3.6V, VLDO1IN=3.6V, VLDO1=3.3V, ILDO1=10 mA.  
 VLDO2 parameters specified at TA=-40 °C to 85 °C, VIN=3.6V, VLDO2IN=3.0V, VLDO2=1.55V, ILDO2=10 mA.  
 VLDO3 parameters specified at TA=-40 °C to 85 °C, VIN=3.6V, VLDO34IN=3.6V, VLDO3=3.3V, ILDO3=10 mA.  
 VLDO4 parameters specified at TA=-40 °C to 85 °C, VIN=3.6V, VLDO34IN=3.6V, VLDO4=3.3V, ILDO4=10 mA.

- Boost converter. The PMIC offers a boost regulator that is not used inside the module but that is available in the pinout of the LGA version for customizations.

Power domain	Regulator type	Output accuracy	Maximum current	Dropout voltage (MAX)	Turn on time (MAX)	Turn off time (MAX)	Quiescent current in OFF mode (TYP)
SWBST	DC/DC	-4.0% / +3%	0.6 A	-	2 ms	-	-

---

**Note** SWBST parameters specified at TA=-40 °C to 85 °C, VIN=VSWBSTITN=3.6V, VLSWBST=5.0V, ISWBST=100 mA.

---

VSYS and VSYS2 are the supply inputs to the regulators and buck converters of the PMIC. Both inputs are available on the module pads and can be connected to a single voltage input or to two different voltages on systems that require high efficiency on the power system:

- VSYS powers SW1A, SW2, LDO1 and LDO34 (shared input for LDO3 and LDO4).
- VSYS2 powers SW1B, SW3 and LDO2.

The power management IC located on the module is responsible for generating all required i.MX6UL processor supplies. Some of the I/O supplies are set on the module. See the following table:

Power domain	Connection
NVCC_NAND	3V3_INT
NVCC_GPIO	3V3_INT
NVCC_SD1	3V3_INT
NVCC_UART	3V3_INT
NVCC_CSI	3V3_INT
NVCC_LCD	3V3_INT

One I/O voltage must be set externally and is left unconnected on the ConnectCore 6UL module: NVCC\_ENET. See the following table for operating range of NVCC\_ENET:

Power domain	Min	Type	Max
NVCC_ENET	1.65 V	1.8/2.8/3.3 V	3.6 V

As shown in the table above, the supply has a wide operating range. In order to provide the most cost-effective and flexible solution for a given use case, the supplies listed in the table must be provided by the carrier board integrating the ConnectCore 6UL module. However, PMIC 3.3V and LDO power rails are dedicated power sources for supplying i.MX6UL power domains.

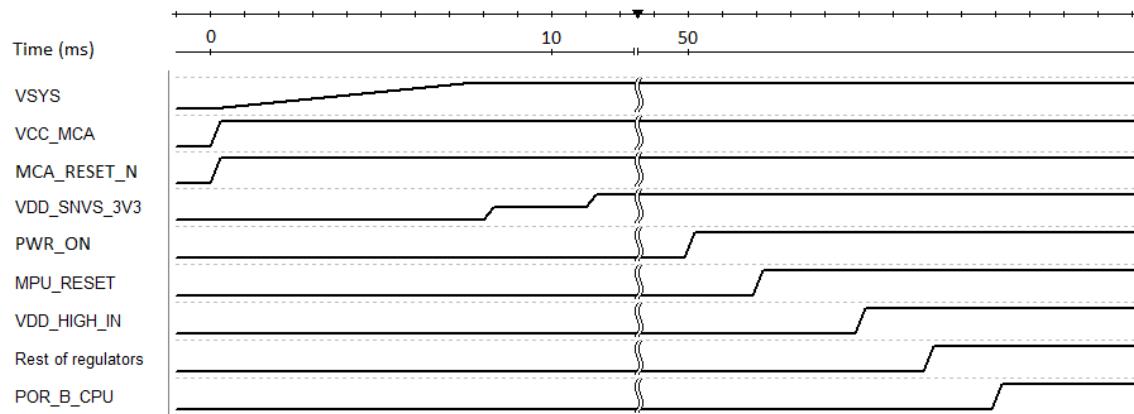

For more information related to the PMIC power-up strategy, refer to section 6.3.5 of the [NXP PF3000 datasheet](#).

## System power-up sequence

When the power supply is connected to the ConnectCore 6UL module, the PMIC and the MCA are the first components to be powered up. VIN is the PMIC input power line, while VCC\_MCA is the MCA input line. The MCA starts to run as soon as it is powered up, but the PMIC follows a fixed initialization process (see the [NXP PF3000 Datasheet](#) for a full description). In this initialization, the first regulator to automatically be powered on is the VDD\_SNVS\_3V3. Once this regulator is up, the PMIC can be switched on by controlling the PWRON pin (the on-off control line of the PMIC). This pin is controlled by the MCA. The MCA will turn on the PMIC after a user-programmable delay (by default 50 ms).

Once the PMIC is switched on, another fixed initialization process starts and the PMIC regulators are turned on following a defined sequence. Finally the CPU reset line (POR\_B\_CPU), which is also controlled by the MCA, is released.

The following time diagram shows the power-up sequence.

## Bootstrap

The ConnectCore 6UL module can be configured to boot from different devices and interfaces as determined by the Boot ROM. The configuration of the booting process of the CPU is done through:

- **BOOT\_MODE** register, which selects the boot mode of the processor.
- eFUSES and/or GPIOs, which determine the boot configuration.

Four boot modes are available on the i.MX6UL processor. Selection between them is done through **BOOT\_MODE[1:0]** bits. The bits are externally configurable on two processor IOs, whose values are latched during boot-up:

<b>BOOT_MODE [1:0]</b>	<b>Boot type</b>
00	Boot from fuses
01	Serial downloader
10	Internal boot
11	Reserved

**BOOT\_MODE[0]** and **BOOT\_MODE[1]** are available on dedicated LGA pads on the module. However, on the castellated pads only **BOOT\_MODE[1]** is available.

---

**Note** **BOOT\_MODE[0]** is set to 0 internally on the module through a 100K pull-down resistor. This means that in applications using only the castellated pads of the module, the only boot modes available are Boot from fuses and Internal boot. However, once Uboot is running, you can select a different boot mode (like serial downloader).

---

## Boot from fuses

Boot from fuses is the recommended boot mode for production purposes. When this boot mode is selected, you must configure several parameters in order to select and configure the boot device of

the system. These parameters are configured through fuses, which are burned in order to set their values. This means that the configuration is irreversible.

BOOT\_CFG1 selects the boot device through BOOT\_CFG1[7:4] bits:

BOOT_CFG1[7:4]	Boot device
0000	NOR/OneNAND (EIM)
0001	QSPI
0011	Serial ROM (SPI)
010x	SD/eSD/SDXC
011x	MMC/eMMC
1xxx	Raw NAND

There are many other registers that configure the different boot devices. For a complete description of the booting configuration, refer to the NXP i.MX 6UltraLite Applications Processor Reference Manual (Chapter 8: System Boot).

## Internal boot

Internal boot is the recommended boot mode for development purposes. When this boot mode is selected, the selection and configuration of the booting process is done through the same registers used when booting from fuses. However, this time the values of some registers are overridden using multiple GPIOs, which are latched during power-up.

The following configuration is done internally in the ConnectCore 6UL module in order to enable booting from the NAND memory:

Bootstrap configuration	Corresponding GPIO	Default configuration
BOOT_CFG2[1]	LCD_DATA9	100K pull-down
BOOT_CFG2[2]	LCD_DATA10	100K pull-down
BOOT_CFG2[3]	LCD_DATA11	100K pull-up
BOOT_CFG2[4]	LCD_DATA12	100K pull-down
BOOT_CFG2[5]	LCD_DATA13	100K pull-up
BOOT_CFG2[6]	LCD_DATA14	100K pull-down
BOOT_CFG2[7]	LCD_DATA15	100K pull-down

You must also set up BOOT\_CFG1[7:0] register when booting from the internal on-module NAND when Internal boot mode is selected. It must be configured externally (outside the module) as shown in the following table:

Bootstrap configuration	Corresponding GPIO	Configuration
BOOT_CFG1[0]	LCD_DATA0	0
BOOT_CFG1[1]	LCD_DATA1	0
BOOT_CFG1[2]	LCD_DATA2	0
BOOT_CFG1[3]	LCD_DATA3	0
BOOT_CFG1[4]	LCD_DATA4	1
BOOT_CFG1[5]	LCD_DATA5	0
BOOT_CFG1[6]	LCD_DATA6	0
BOOT_CFG1[7]	LCD_DATA7	1

Digi recommends you use 10K pull-up and pull-down resistors to configure each line.

The BOOT\_CFG1 and BOOT\_CFG2 register lines are not dedicated lines of the CPU. This means that the values of these lines are latched during the power-up, but have a different functionality once the system is up and running. In this case, these lines belong to the LCD interface. In order to protect the value of these registers while the system is booting, Digi recommends you use a protection circuitry as shown in sheet 3 of 7, "Boot selection," of the ConnectCore 6UL reference designs. See [ConnectCore 6UL design files](#).

## Serial downloader

You can use the serial downloader boot mode for device recovery. The serial downloader allows you to download a program image to the chip through a USB or UART serial connection. When any of the standard boot modes is selected but the booting process doesn't succeed (for instance due to wrong booting device or corrupted images) the CPU automatically jumps to the serial downloader boot mode.

## Wireless interfaces

The ConnectCore 6UL system-on-module combines a wireless local area network (WLAN) and Bluetooth (BT) dual solution to support IEEE802.11 a/b/g/n/ac WLAN standards and BT 4.2 enabling seamless integration of WLAN/BT and Low Energy technology. Digi also offers a non-wireless variant of the ConnectCore 6UL module.

The following sections include specifications for the wireless interfaces available on the ConnectCore 6UL module.

### WLAN 802.11a/b/g/n/ac

The 2.4 GHz band on the ConnectCore 6UL module supports 20/40 MHz bandwidths, and the 5 GHz band supports 20/40/80 MHz bandwidths.

The following sections specify the performance of the WLAN IEEE 802.11a/b/g/n/ac interface on the ConnectCore 6UL module.

### **Modulation and data rates**

The following tables list modulation values for ConnectCore 6UL module supports the following WLAN standards.

Mode	Modulation & coding	Rate
802.11b	DBPSK	1 Mbps
	DQPSK	2 Mbps
	CCK	5.5 Mbps
	CCK	11 Mbps
802.11ga	BPSK-1/2	6 Mbps
	BPSK-3/4	9 Mbps
	QPSK-1/2	12 Mbps
	QPSK-3/4	18 Mbps
	16QAM-1/2	24 Mbps
	16QAM-3/4	36 Mbps
	64QAM-2/3	48 Mbps
	64QAM-3/4	54 Mbps
802.11n	BPSK-1/2	MCS0
	QPSK-1/2	MCS1
	QPSK-3/4	MCS2
	16QAM-1/2	MCS3
	16QAM-3/4	MCS4
	64QAM-2/3	MCS5
	64QAM-3/4	MCS6
	64QAM-5/6	MCS7

Mode	Modulation & coding	Rate
802.11ac	BPSK-1/2	MCS0
	QPSK-1/2	MCS1
	QPSK-3/4	MCS2
	16QAM-1/2	MCS3
	16QAM-3/4	MCS4
	64QAM-2/3	MCS5
	64QAM-3/4	MCS6
	64QAM-5/6	MCS7
	256QAM-3/4	MCS8
	256QAM-5/6	MCS9

**Note** Rates MCS8 & MCS9 are only available in receive mode.

#### Data rate (Mbps) - Non Short Guard Interval (Non-SGI)

Data rate (Mbps)		802.11b		802.11ga		802.11n		802.11ac		
Modulation		DBPSK	CCK	BPSK-1/2	64QAM-3/4	BPSK-1/2	64QAM-5/6	BPSK-1/2	64QAM-5/6	256QAM-5/6
		1 Mbps	11 Mbps	6 Mbps	54 Mbps	MCS0	MCS7	MCS0	MCS7	MCS9
2.4 GHz	HT20	1	11	6	54	6.5	65	6.5	65	
	HT40					13.5	135	13.5	135	180
5 GHz	HT20			6	54	6.5	65	6.5	65	
	HT40					13.5	135	13.5	135	180
	HT80							29.3	292.5	390

#### Data rate (Mbps) - Short Guard Interval (SGI)

Mode		802.11b		802.11ga		802.11n		802.11ac		
Modulation		DBPSK	CCK	BPSK-1/2	64QAM-3/4	BPSK-1/2	64QAM-5/6	BPSK-1/2	64QAM-5/6	256QAM-5/6
		1 Mbps	11 Mbps	6 Mbps	54 Mbps	MCS0	MCS7	MCS0	MCS7	MCS9

Mode		802.11b		802.11ga		802.11n		802.11ac		
2.4 GHz	HT20	1	11	6	54	7.2	72.2	7.2	72.2	
	HT40					15	150	15	150	200
5 GHz	HT20			6	54	7.2	72.2	7.2	72.2	
	HT40					15	150	15	150	200
	HT80							32.5	325	433.3

### RF channels

The ConnectCore 6UL module supports the following frequency bands.

RF band	Ch. BW	Ch. spacing	Channel number (Center freq. MHz)
2.4 GHz	20 MHz	5 MHz	1(2412), 2(2417), 3(2422), 4(2427), 5(2432), 6(2437), 7(2442), 8(2447), 9(2452), 10(2457), 11(2462), 12(2467), 13(2472), 14(2484)
	40 MHz	5 MHz	3(2422), 11(2462)

	HT80							-76	-58	-51

**Note** Specification is subject to change.

## Antenna ports

The ConnectCore 6UL module has two antenna ports: one on the module via a dedicated U.FL connector, and another on the LGA pads. Both antenna ports support WLAN and Bluetooth functionality. You can use the control signal RF1\_INT/nEXT to select between the on-module antenna port (U.FL connector) and the external antenna port (LGA pad). This control signal has a 10K pull-up populated on the module, which means that the on-module antenna port (U.FL connector) is active by default. Pulling RF1\_INT/nEXT low activates the external antenna port and disables the on-module antenna port.

## Bluetooth

The ConnectCore 6UL module supports both Bluetooth and Bluetooth Low Energy protocols:

- Bluetooth 4.2 (BT4.2); backwards compatible with BT 1.X, 2.X + Enhanced Data Rate, BT 3.X, BT 4.0 and BT 4.1 Bluetooth class 1 and class 2 power-level transmissions
- Integrated WLAN-BT coexistence

## RF control signals

The following signals are **not** supported by the current firmware of the WLAN/BT transceiver:

- WLAN\_RF\_KILL# (pad B17)
- BT\_RF\_KILL# (pad B18)
- WLAN\_LED (pad B19)
- BT\_LED (pad B20)

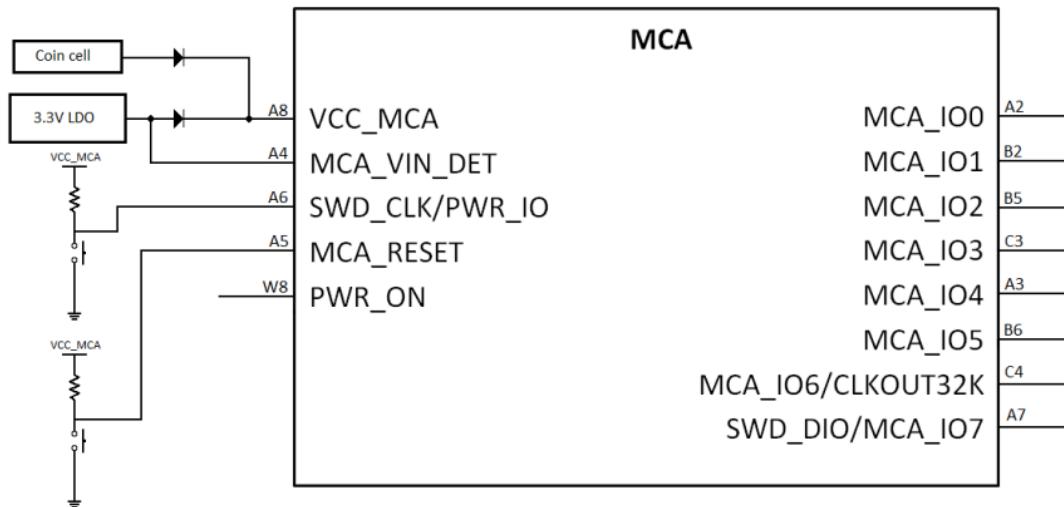

## Micro Controller Assist™

The Micro Controller Assist, or MCA, is a small microcontroller that is deeply integrated into the design of the ConnectCore 6UL module. It assists the i.MX6UL processor with advanced operations related to power management, security, and system reliability. The functionality provided by the MCA includes:

- Advanced power management such as power key button, wake up sources, and PMIC control in low power.
- Peripheral extensions such as RTC, watchdog, and tamper pins.

The MCA and the i.MX6UL are connected through an I2C interface and an interrupt line. The microcontroller provides up to eight general purpose IOs that can be configured with different modes to provide functionality such as digital input/output or ADC.

The i.MX6UL can update the MCA firmware over the I2C bus. See the [MCA software documentation](#) for additional information about this process.

## ConnectCore 6UL module lines related to the MCA

Pin number	Pin name	Pin direction	Type	Definition
A2	MCA_IO0	Bi-directional	Digital and analog	General purpose Input/Output.
A3	MCA_IO4	Bi-directional	Digital and analog	General purpose Input/Output.
A4	MCA_VIN_DET	Input	Analog	Input voltage detection line. Connect to VCC_MCA.
A5	MCA_RESET	Input	Digital	Reset input line, active low.
A6	SWD_CLK/PWR_IO	Input	Digital	Power on/off input line, active low. SWD interface clock line.

Pin number	Pin name	Pin direction	Type	Definition
A7	SWD_DIO/MCA_IO7	Bi-directional	Digital	General purpose Input/Ouput. SWD interface data line.
A8	VCC_MCA	Input	Analog	Input power supply of the MCA.
B2	MCA_IO1	Bi-directional	Digital and analog	General purpose Input/Output.
B5	MCA_IO2	Bi-directional	Digital	General purpose Input/Output.
B6	MCA_IO5	Bi-directional	Digital and analog	General purpose Input/Output.
C3	MCA_IO3	Bi-directional	Digital and analog	General purpose Input/Output.
C4	MCA_IO6/CLKOUT32K	Bi-directional	Digital	General purpose Input/Output. 32KHz clock output.
W8	PWR_ON	Output	Digital	Output power on/off line. Set to high level* during power off.

\* low level

## Reset control

Asserting and de-asserting the MCA\_RESET line wakes the ConnectCore 6UL module from any power mode (suspend/power off). Then, the microcontroller executes the programmed firmware.

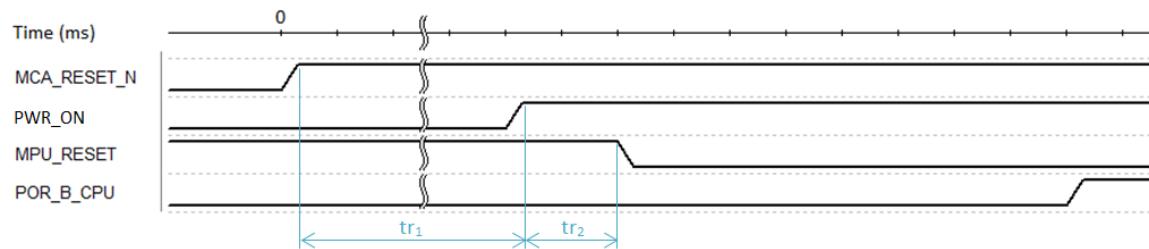

The MCA, in cooperation with the PMIC, controls the reset line of the i.MX6UL processor (POR\_B). The MCA\_RESET pin is the main reset input of the ConnectCore 6UL module. This pin is a pseudo open-drain with an internal pull up. Asserting the MCA\_RESET line low sets the MCA into reset state, and it remains in this state until the line is de-asserted.

During system initialization, the MCA performs the following actions:

- Asserts the PWR\_ON line low for a configurable number of milliseconds (0-255 ms with a default value of 50ms). This powers the PMIC off, switching off all regulated outputs of the PMIC. You can disable this power cycle by setting the timer to 0.
- Asserts the PWR\_ON line high to power the system on (assuming it was asserted low before).
- Keeps POR\_B asserted low for a configurable number of miliseconds.
- Asserts the POR\_B line high to start the execution of the firmware on the i.MX6UL processor.

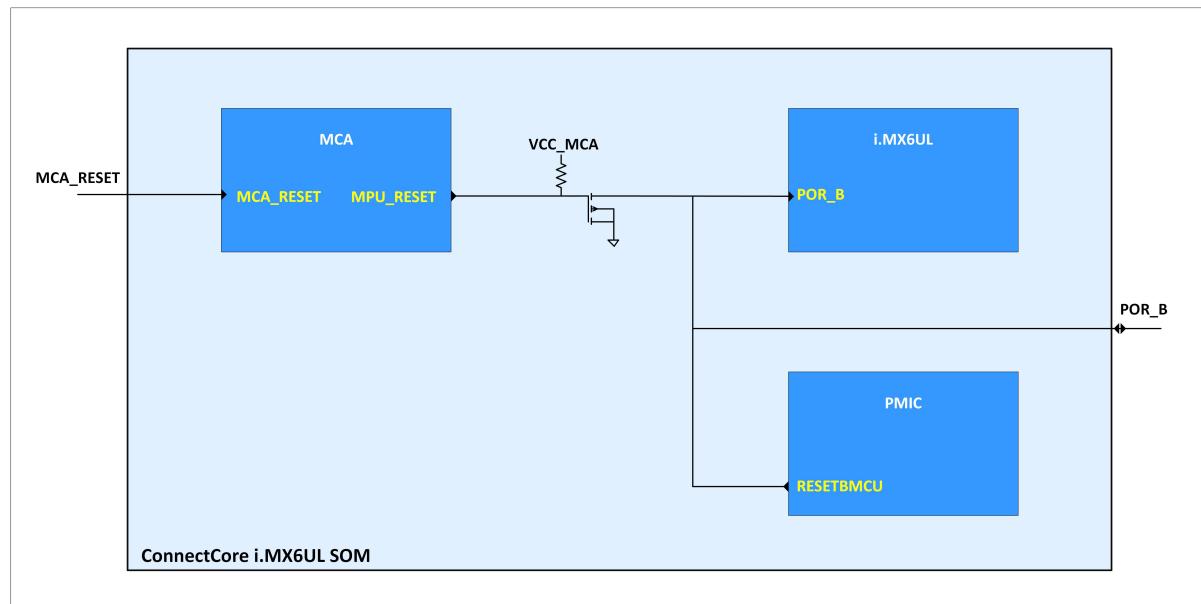

The following time diagram represents the reset sequence. You can configure the reset timing. Default values are as follows:

- tr1: 50 ms
- tr2: 2 ms

See [System power-up sequence](#) for more information about the power-up sequence of the ConnectCore 6UL.

**Note** The POR\_B line is also connected to the PMIC. The PMIC won't release this line until it is switched on and the entire starting sequence is finished (a few ms after the latest regulator is turned on). This means that even if the MCA releases the reset line before the PMIC is ready, the CPU won't go out of reset. This occurs on the ConnectCore 6UL module: the MCA releases the CPU reset line by putting the MPU\_RESET line high but there's a delay since this GPIO goes high until the POR\_B\_CPU line goes high. The delay occurs because the PMIC is still not completely initialized.

See the [MCA software documentation](#) for additional information on the configuration of the MCA.

## IOs

The ConnectCore 6UL MCA provides up to eight configurable IOs.

Since the general purpose IOs do not incorporate internal pull-ups or pull-downs, you may have to add the components to the exterior of the module carrier board.

The following table lists all available MCA IOs with capabilities and module pad:

MCA IO	PAD LGA/CS*	Digital I/O	IRQ capable	ADC	32KHz clock	1.2 Vref
MCA_IO0	A2/76	✓	✓	✓		
MCA_IO1	B2	✓	✓	✓		
MCA_IO2/EXT_VREF	B5	✓	✓			✓
MCA_IO3	C3	✓		✓		
MCA_IO4	A3/75	✓		✓		
MCA_IO5	B6	✓	✓	✓		
MCA_IO6/CLKOUT32K	C4	✓			✓	
SWD_DIO/MCA_IO7	A7/71	✓				

\* CS = castellated pads

### Digital IOs

All MCA IOs can be configured as digital inputs/outputs, which are powered from the MCA\_VCC power rail.

The digital outputs preserve the output value set in all operating modes, except in power off and coin cell modes where the IOs are reconfigured to high impedance state to preserve power.

---

**Note** Since the general purpose IOs do not incorporate internal pull-ups or pull-downs, you may need to add the components to the exterior of the module carrier board.

---

### MCA IRQs

You can configure a subset of the MCA IOs as interrupt inputs, using the MCA software to configure the active edge of the interrupt (rising, falling, or both). When one or more MCA IRQs are activated, the MCA interrupts the main processor through the corresponding IRQ line, signaling the active IRQs in the IRQ status registers. The IRQ inputs can wake the system from any low power mode (suspend or power off).

See the MCA software documentation for additional information about how to configure and access the MCA IRQ lines.

### Analog to Digital Converter

You can configure up to five MCA IOs as Analog to Digital channels in addition to the ones provided by the i.MX6UL CPU. The index of the MCA ADC channels corresponds to the index of the MCA IO. This means that the ADC channel 0 corresponds to the MCA\_IO0, the ADC channel 1 to the MCA\_IO1, and so on.

The result of the ADC conversion for a given input voltage is inversely proportional to the reference voltage of the ADC. For the MCA ADCs, the reference voltage corresponds to the MCA\_VCC voltage. (Note that the i.MX6UL ADCs have a different reference voltage.) The MCA ADC provides 12-bit of resolution with right-justified, unsigned format output. These ADCs are suitable for low-frequency sampling (under 10 Hz). For higher frequency sampling, Digi recommends the CPU ADC channels.

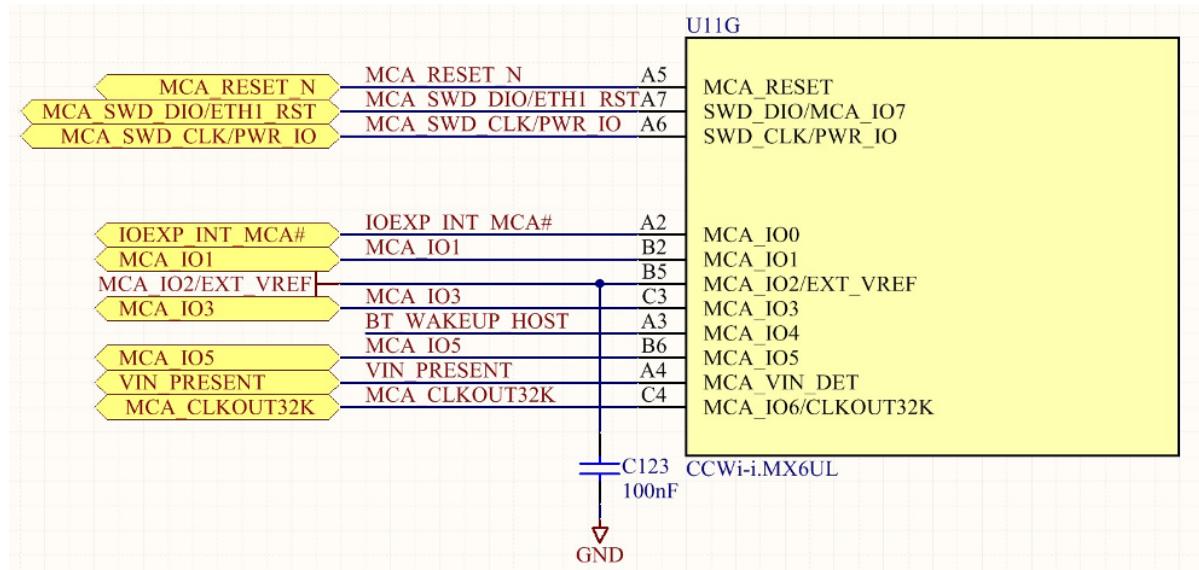

See the [MCA software documentation](#) for additional information about how to configure and access the MCA ADCs.

## External voltage reference

The MCA\_IO2/EXT\_VREF pin provides an accurate voltage reference of 1.2V that can be used to provide a reference voltage for sensors and/or analog devices (such as comparators or DACs).

When this pin is used as external reference voltage or as the internal reference of the MCA analog-to-digital converter, an external capacitor of 100nF must be connected between the pin and ground and as close as possible to the module pad.

The default configuration of the MCA\_IO2/EXT\_VREF pin is as IO. You must use software to configure the pin for external voltage reference. See the software documentation for additional information about how to control the function of this pin.

Note that the voltage reference continues normal operation in low power modes (suspend and power off). Therefore, if the voltage reference is enabled during normal operation but is not required for low power operation, Digi recommends using the software to disable it before entering low power in order to minimize the power consumption, and re-enable it when resuming normal operation.

## External 32KHz clock output

The MCA\_IO6/CLKOUT32K pin is a 32.768 Hz square wave output that can be used as clock input by peripherals requiring a low-frequency, high-accuracy clock.

---

**Note** The default configuration of the MCA\_IO6/CLKOUT32K pin is as IO. You must use software to configure the pin as 32KHz clock output. See the [MCA software documentation](#) for additional information about how to control the function of this pin.

---

Note that the 32KHz clock output continues normal operation in low power modes (suspend and power off). Therefore, if the 32KHz clock output is enabled during normal operation but is not required for low power operation, Digi recommends using the software to disable it before entering low power in order to minimize power consumption, and re-enable it when resuming normal operation.

## Watchdog

The MCA implements a watchdog timer in its firmware. The MCA watchdog resets the system, or only the i.MX6UL CPU, if the software running on the main processor fails to execute properly and does not reset the watchdog timer on time.

The main features of the MCA watchdog include:

- Configurable timeout between 1 and 255 seconds.
- Configurable to generate interrupt or system reset.
- Configurable to generate full-system reset (including the MCA itself) or CPU-only reset. Full-system reset can include a PMIC off/on, depending on the device configuration.

See the [MCA software documentation](#) for additional information about how to configure and access the watchdog timer.

## Real-time clock

The MCA implements a Real-Time Clock (RTC) in its firmware. The i.MX6UL CPU internal RTCs are disabled by default because the MCA RTC is preferred due to its superior power consumption efficiency. To preserve the date during power-off, you must connect a coin cell battery following the design notes provided in the Power Supply Architecture section. You must also connect the MCA line VIN\_PRESENT following the design guidelines in [Power supply architecture](#) in order to detect power loss and automatically switch to RTC mode.

The main features of the MCA RTC include:

- Date/time registers to keep the system time (backed up by the coin cell battery).
- Programmable alarm to generate and interrupt. This alarm can be used to wake the system from low power modes (suspend and power off).

See the [MCA software documentation](#) for additional information about how to configure and access the watchdog timer.

## Tamper support

The tamper interface provides a mechanism to detect any unauthorized attempt to access the system, such as the opening of the enclosure. The tamper support included in the ConnectCore 6UL is implemented in the MCA with the following capabilities:

- Configure up to two tamper interfaces, each with an optional digital output.
- Rely on tamper detection event in power-off and coin cell (battery backup) modes.
- Register tamper event(s) in the non-volatile memory of the MCA.
- Alert the host CPU when a tamper event occurs.
- Respond to a tamper attack with actions such as erasing a critical data partition of the flash.

### Tamper pins

The ConnectCore 6UL module supports up to two tamper interfaces (tamper0 and tamper1). Each interface has an associated IO (tamper pin) used to detect the tamper event (through a voltage transition on the IO) and, optionally, an output IO (tamper output) that can be used to enable or disable peripherals, for instance to cut the power of a peripheral. The IOs of each tamper interface can be configured independently and have the following configuration options:

- The MCA IO used for tamper detection, from the available MCA IOs that are IRQ-capable.
- The active level (tampering) of the tamper input.
- The MCA IO used as tamper output, when enabled, that is activated when a tamper condition has not been acknowledged.
- The logic level that is set in the tamper output when a tamper event occurs.

The MCA IO table provides information about the capabilities of the MCA IO pins so you can easily identify suitable IOs to be used as tamper inputs. Any MCA IO pin can be configured as tamper output.

### ***Tamper pin configuration***

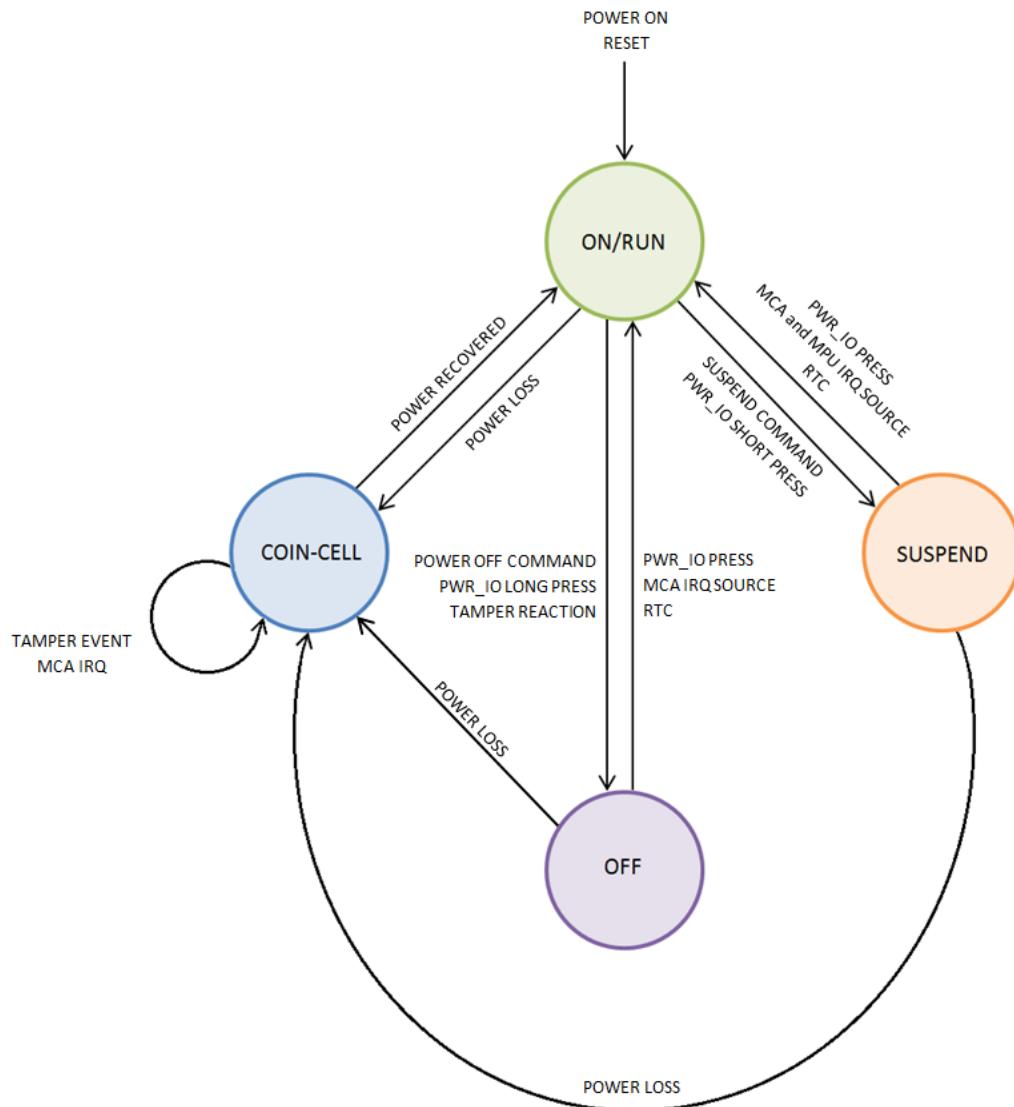

To learn more about tamper pin configuration, see [Tamper detection interface](#) in the software documentation.

## **Power management**

The MCA plays a key role in the power management activities of the ConnectCore 6UL module. In cooperation with the i.MX6UL processor, the MCA controls the power states of the PMIC, provides multiple wake up sources to transition between power modes. It also allocates dedicated signals to capture power events and indicate the system power state, allowing you to control external power sources and indicators.

### ***Power modes***

The module provides four different power operating modes: ON/RUN, OFF, SUSPEND, and COIN-CELL. The following figure shows the state diagram and the events to switch between states.

### ON/RUN mode

The module enters the ON state after a power-on or system-reset event. In this mode, the PMIC is running at full power so all voltage regulators are generating the nominal voltage for this mode. The cpu reset line is de-asserted and the processor is running at normal speed, performing DVFS if the system was configured to do so. In this state, the PWR\_ON line is asserted low, indicating that the module is ON.

Note that the specific state of the regulators (on/off) and the voltage in this mode are controlled by the firmware running on the i.MX6UL processor. The PMIC starts with the default settings configured on the OTP area, but once the software takes control it applies the specific configuration implemented in the firmware.

### SUSPEND mode

The suspend mode (also known as suspend-to-ram mode) is the low-power mode that allows the module to preserve ram content. When the module enters SUSPEND, the following actions take place:

- The processor goes into low power, disabling as much functionality as possible and keeping active only the peripherals configured to wake the system from SUSPEND.
- The DDR memory is set to self-refresh mode to preserve its contents while reducing power consumption.
- The PMIC goes into standby mode, configuring the regulators in the configured mode (on, off, with a different voltage compared to ON state).
- The MCA goes into sleep mode, keeping active the peripherals that always run in low power modes (like the RTC) and those configured to wake up the system (such as IRQs and power IO).

### **OFF mode**

The module enters OFF mode after a power-off event. In this mode:

- The PMIC is set to the OFF state and all the voltage regulators, except VSNVS, are switched off.
- The PWR\_ON line is asserted low, indicating that the module is in OFF state.
- The MCA goes into sleep mode, keeping active the peripherals that always run in low-power modes (like the RTC) and those configured to wake up the system (such as IRQs and power IO).

### **COIN-CELL mode**

In COIN-CELL mode, the module only powers the MCA from the coin-cell battery, leaving the rest of the module power inputs switched off. In this mode, the MCA remains in sleep mode, updating the RTC and monitoring the following events:

- Tamper events that would be registered in the NVRAM memory of the MCA and would assert the Tamper output if enabled.
- Power in MCA\_VIN\_DET, which indicates that there is sufficient voltage to generate a power-on event.

### **Power IO signal/Power button**

The MCA provides a signal (PWR\_IO) to detect external events that trigger a transition between the different power modes described in [Power modes](#). The pin has wake-up interrupt/event capabilities, it is active low, and it does not provide an internal pull-up. (The pull-up resistor must be added externally if required.) This signal is ideal for connecting a power button or the output of a peripheral that controls the power state of the module and its transitions. The firmware provides a configurable debounce filter to improve noise immunity and filter rebounds on push buttons. When the PWR\_IO signal is asserted low, one of the following events occurs:

- If the duration of the assertion is short (time configurable by the user) the system will trigger an interrupt that, commonly, indicates the host processor that the system should enter suspend state.
- If the low-pulse duration is long enough (again, time configurable by the user) the system will trigger the power off interrupt, to indicate the host processor to start a transition to OFF state.
- If the system does not enter OFF state before a configurable guard timer expires, the MCA will automatically set the OFF state.

Digi recommends you use an external pull-up resistor of 100K to VCC\_MCA in this SWD\_CLK/PWR\_IO line.

### **MCA\_VIN\_DET signal**

The on-module MCA is powered from a dedicated external power rail, VCC\_MCA. As recommended in the reference designs (see [Power supply architecture](#)), this power supply is provided by an external 3.3V regulator. If the system requires system time to be kept when there is no power, you must use a coin-cell battery to power the MCA while it keeps the RTC up to date in low-power mode. The MCA uses the MCA\_VIN\_DET input to monitor the input voltage and automatically switch to RTC mode to keep the system time and save power. Follow the design guidelines provided in Power supply architecture to apply the proper voltage to MCA\_VIN\_DET when there is a coin-cell battery in the system and when there is not.

### **MCA firmware update**

The i.MX6UL processor can update the firmware of the MCA. See the [MCA software documentation](#) for additional information about the MCA firmware update process.

## **CryptoAuthentication device**

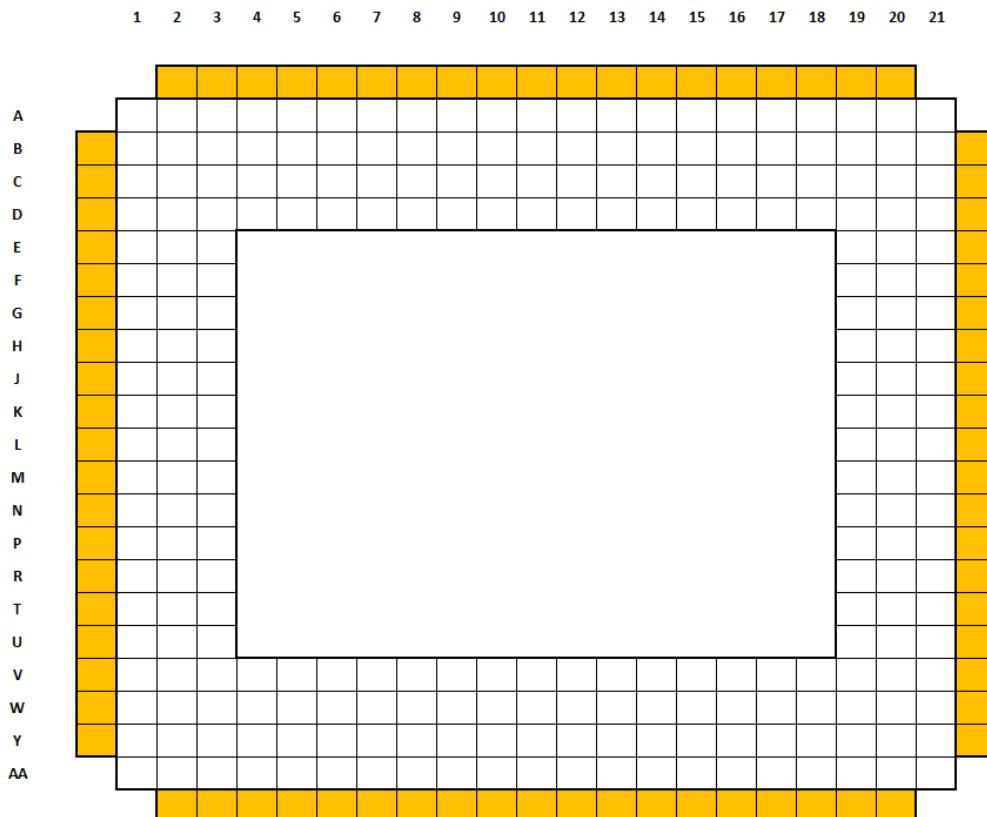

The ConnectCore 6UL module includes an Atmel CryptoAuthentication Device. This is a highly secure cryptographic co-processor with secure hardware-based key storage. It includes the following features:

- Performs high-speed public key (PKI) algorithms (ECDSA and ECDH).
- NIST standard P256 elliptic curve support.
- SHA-256 hash algorithm with HMAC option.
- 256-bit key length.
- Storage for up to 16 keys.
- Two high-endurance monotonic counters.
- Guaranteed unique 72-bit serial number.
- Internal High-quality FIPS Random Number Generator (RNG).
- 10 Kb EEPROM memory.

See the [software documentation](#) for information about supported cryptoauthentication features.

## **Module pinout - general layout**

The ConnectCore 6UL module has a mixed pad structure. The module provides 245 LGA pins, 76 of them connected to the peripheral castellated pads. The general layout can be found on the following diagram:

- White cells: LGA pads
- Orange cells: castellated pads

---

**Note** Pad A1 is unconnected. This pad is meant for module-orientation purposes; its shape is square, whereas all other pads are circular. Pad A1 should not be soldered down to a corresponding pad on the carrier board.

---

## External signals and pin multiplexing

The following tables provide the pinout information of the ConnectCore 6UL module. For additional information related to the signals listed in the table, refer to the NXP i.MX6UL technical documentation.

### *Castellated pad signals and multiplexing*

Castellated pad	ConnectCore 6UL pad	ConnectCore 6UL signal name	i.MX6UL pad name	Multiplexing	Power group	Comments

## **Module specifications**

---

The following sections describe the specifications for the ConnectCore 6UL module.

Electrical specifications .....	116
Power consumption .....	116
Mechanical specifications .....	122
Environmental specifications .....	125
Socket options .....	125

## Electrical specifications

The following tables detail the power supply voltages of the ConnectCore 6UL module.

### With front-end LDO

Power domain		Min	Typ	Max	Unit
VPWR	In regulation	4.6	-	5.5	V
	In dropout operation	3.7	-	4.6	V
VSYS		4.3	4.4	4.55	V
VSYS2		2.8	-	4.5	V
VCC_LICELL		2.4	3	3.6	V
VCC_MCA		2.4	3	3.6	V

### Without front-end LDO

Power domain	Min	Typ	Max	Unit
VPWR	0			V
VSYS	3.7	4.4	4.5	V
VSYS2	2.8	4.4	4.5	V
VCC_LICELL	2.4	3	3.6	V
VCC_MCA	2.4	3	3.6	V

## Power consumption

This section contains data on the power consumption of the ConnectCore 6UL module using measurements from the following power domains:

- **VSYS:** the input power rail of the module (PMIC input). Power consumption associated with other power domains that power carrier board peripherals (3V3\_EXT and LDO4\_1V8) will be discounted from the values since they are powering external circuitry. However, the VCC\_ENET power domain (which is powered externally) as well as VCC\_MCA (which is powering the on-module MCA) are included the module power consumption. So, the global power consumption of the ConnectCore 6UL module is calculated as:

$$P_{CC6UL} = P_{SYS} + P_{VCC\_MCA} + P_{VCC\_ENET} - P_{3V3\_EXT} - P_{LDO4\_1V8}$$

- **VCC\_MCA:** input power rail of the on-module MCA. While this power consumption is part of the module, its input is different than the PMIC (VSYS) so it is measured separately. It's important

to note that the MCA power consumption is very stable in run-time and fluctuates very little from one use case to another. So, for this element, only three use cases are represented: suspend to RAM, power-off, and run-time.

---

**Note** These power consumption numbers should be considered guidelines only, never as fixed or absolute values. Actual values will depend entirely upon individual setup and system application.

---

**Note** The wireless tests were run with the device in test mode. Since in test mode the system is configured to work at 99% time transmitting, these values can be considered to be the highest power consumption associated with each wireless mode. In real wireless transmission, many modes and modulations may be used in a single connection depending on the environmental conditions, resulting in different power consumption numbers. See [Power consumption: Real wireless transmission](#).

---

## Power consumption use cases

This section describes the use cases that were used to measure power consumption of the ConnectCore 6UL module.

### Suspend

System in suspend-to-RAM mode. The power consumption in this operation mode will be evaluated when using and not using the PMIC Front-end LDO. See [Power supply](#) for more information about how to power up the ConnectCore 6UL module.

**CAUTION!** You can achieve minimum power consumption numbers by disabling both 3.3V power domains. However, in some applications it may not be possible to switch them off, depending on what they are powering.

---

### Power-off

System in power-off with RTC enabled. RTC is running in the MCA. The power consumption in this operation mode will be also evaluated when using and not using the PMIC Front-end LDO.

### IDLE

System up and running. Ethernet and wireless disabled.

### Decoding video

System up and running with the following configuration:

- Ethernet and wireless disabled.
- Fusion7 parallel display connected to the system.

Includes two different use cases:

- Display connected in IDLE mode (without decoding video).
- CPU decoding video.

### CPU stress

System up and running with the following configuration:

- One Ethernet interface up and linked. The other one disabled.
- USB connected to the system.
- Hanoi application running. (The Hanoi application stresses the CPU and put it at 100% work load.)

## Wireless

In all other use cases, wireless was disabled in order to ease the power consumption calculation. This dedicated section describes the power consumption of the ConnectCore 6UL module when transmitting (in **test mode**) in different wireless modes on both 2.4 GHz and 5 GHz channels (see [Power consumption: Real wireless transmission](#)):

2.4 GHz:

- 99% time transmitting.
- Channel 6 (2437 MHz).

5 GHz:

- 99% time transmitting.
- Channel 120 (5600 MHz).

In the real wireless transmission scenario, the ConnectCore 6UL module is connected to an AP (transmitting and receiving):

- Ethernet disabled.
- 50MB file transmitted and received between the DUT and the AP.
- Connection in the 802.11g/n mode at 2.4 GHz (2437 MHz channel).
- In a real wireless transmission, modulation and bandwidth are configured automatically.

## Wireless UART Bridge

### Hardware setup

- ConnectCore 6UL module mounted on a SBC Express.
- UART4 connected to a host PC serial port (through a TTL-to-RS232 adapter).
- Console connected to the host PC.

### Test case configuration

- Continuous traffic through the UART4, commanded through the Console port (stressing both UARTs):
  - Checks all bit rates below 115200.
  - Checks different parities and packet sizes.
- Wireless up and running:
  - 100 K file transmitted and received between the DUT and the AP, so there will be also reception through the wireless interface. The test is continuously sending the packages, so more than one transmission is executed every five seconds.
  - Connection in the 802.11g/n mode at 2.4 GHz (2437 MHz channel).
- I2C1 bus up and running (no specific actions taken on this interface).

The power consumption contribution of the serial buses, as the I2C or the UART, is negligible compared to the wireless or a high CPU load (such as decoding video or executing dedicated computational applications). See [Power consumption: Wireless-UART bridge](#).

### **Power consumption debugging**

You can use the ConnectCore 6UL SBC Express to simplify the design and debugging of optimized power consumption for the ConnectCore 6UL module. Specific current measurement options have been added for measuring VSYS and VCC\_MCA going to the ConnectCore 6UL module. To use the current measurement option on VSYS, depopulate R113 and populate J15. Connect a multimeter across J15 to measure VSYS current flowing to the module. You can apply a similar procedure to R114 and J16 to measure VCC\_MCA current.

You can also use the ConnectCore 6UL SBC Express to test VSYS supplies below 4.5V, which are typically required for battery operation. In order to facilitate this mode, ground VPWR (R115 populated and R6 depopulated) and leave LDOG unconnected (depopulate C1 and U1). To connect the power connector J3 to VSYS, populate R116. In this configuration, the module must be supplied by a voltage between 4.5V and 3.7V. The lower limit of 3.7V is mandatory for maintaining a 3.3V output on the buck converters of the PMIC.

---

**Note** The 3.7V lower limit only applies to VSYS and not VSYS2 on a battery-operated design, since VSYS2 is supplying only buck converters with much lower output voltage. In this configuration, you can connect a battery directly to VSYS2 as long as you have a buck boost regulator for VSYS. While this mode of operation is supported by the ConnectCore 6UL module, the ConnectCore 6UL SBC Express does not provide options to test/evaluate it.

---

## **Global power consumption**

The following tables list the global power consumption of the ConnectCore 6UL module when the system is under the use cases described below.

### **Suspend and power-off modes**

	Suspend-to-RAM mode		Power-off mode	
	Front-end LDO used (VSYS = 4.4V)	Front-end LDO not used (VSYS = 3.8V)	Front-end LDO used (VSYS = 4.4V)	No Front-end LDO used (VSYS = 3.8V)
<b>Whole module</b>	17.8 mW	8.55 mW	1.65 mW*	1.32 mW*
<b>MCA</b>	12 uW		7.5 uW	

---

**Note** \* See [Power supply](#) for detailed information about how to optimize the power consumption in low power modes.

---

**Run-time modes**

		Run-time		
	IDLE	Display connected (IDLE)	Decoding video	CPU stress
<b>Whole module</b>	0.635 W	0.649 W	0.868 W	0.840 W
<b>MCA</b>	20 mW			

**Note** These power consumption numbers should be considered guidelines only, never as fixed or absolute values. Actual values will depend entirely upon individual setup and system application.

**Power consumption: Wireless power consumption increase**

The following tables shows the power consumption increase of the ConnectCore 6UL module when transmitting in 2.4 GHz and 5 GHz modes:

2.4 GHz modes	Power (dBm)	Continuous Tx (99%)
11b 1 Mbps 20MHz	18	1.123 W
11b 11 Mbps 20MHz	18	1.086 W
11g 6 Mbps 20MHz	18	0.991 W
11g 54 Mbps 20MHz	18	0.783 W
11g/n MCS0 20MHz	18	0.976 W
11g/n MCS7 20MHz	15	0.643 W
11g/n MCS0 40MHz	17	0.932 W
11g/n MCS7 40MHz	15	0.552 W

5 GHz modes	Power (dBm)	Continuous Tx (99%)
11a 6 Mbps 20MHz	13	1.095 W
11a 54 Mbps 20MHz	11	0.801 W
11a/n MCS0 20MHz	13	1.083 W
11a/n MCS7 20MHz	10	0.743 W
11a/n MCS0 40MHz	12	1.052 W
11a/n MCS7 40MHz	9	0.636 W
11ac MCS0 20MHz	13	1.097 W
11ac MCS7 20MHz	10	0.712 W
11ac MCS8 20MHz	9	0.672 W

5 GHz modes	Power (dBm)	Continuous Tx (99%)
11ac MCS9 40MHz	7	0.540 W
11ac MCS9 80MHz	6	0.467 W

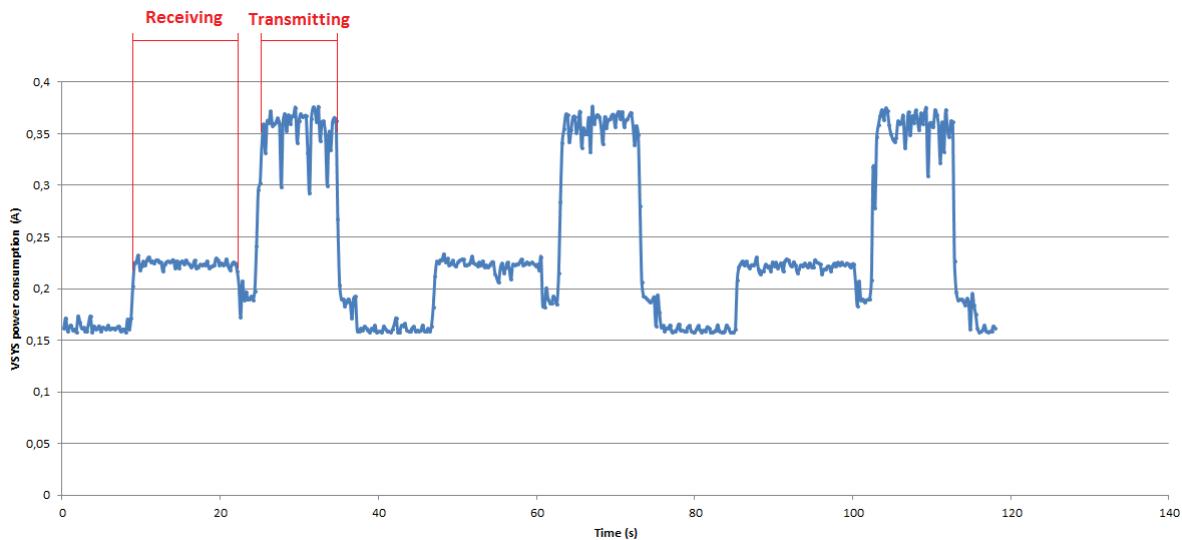

**Note Continuous Rx**

**Continuously receiving data (continuous Rx) in test mode has almost no effect on the power consumption of the module.** In real transmissions, there won't be a continuous reception use case because the system will be always transmitting some synchronization data when receiving, and the power consumption will be increased as observed in [Power consumption: Real wireless transmission](#) (but never as much as when transmitting).

**Note** These power consumption numbers should be considered guidelines only, never as fixed or absolute values. Actual values will depend entirely upon individual setup and system application.

## Power consumption: Real wireless transmission

The following plot shows the power consumption of the ConnectCore 6UL VSYS power domain during a real wireless transmission:

The power consumption increase of the real wireless transmission is calculated by taking the mean power consumption value of the transmission and receiver bursts:

	Power consumption increase
Transmission	0.849 W
Reception	0.279 W

As expected, the transmission power consumption is lower than the maximum observed in the tables above on the 802.11g/n mode (0.976 W in 11g/n MCS0 20MHz). **In a real wireless transmission, modulation and bandwidth are configured automatically.**

---

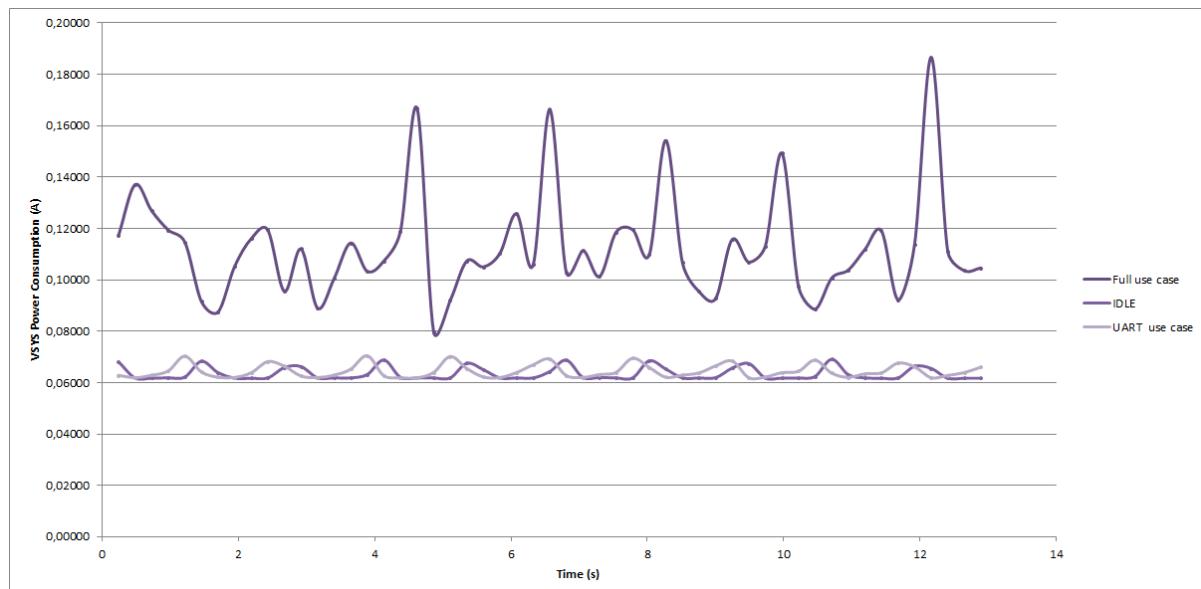

**Note** These power consumption numbers should be considered guidelines only, never as fixed or absolute values. Actual values will depend entirely upon individual setup and system application.

---

## Power consumption: Wireless-UART bridge

The following table shows average power consumption of each operating mode:

	IDLE	UART	UART+Wireless
<b>Module power consumption</b>	0.3011 W	0.30589 W	0.524 W

---

**Note** Average power consumption was calculated after approximately a minute of sampling data, but the plot shows power consumption over 13 seconds for a more detailed view of power consumption oscillations.

---

**Note** These power consumption numbers should be considered guidelines only, never as fixed or absolute values. Actual values will depend entirely upon individual setup and system application.

---

## Mechanical specifications

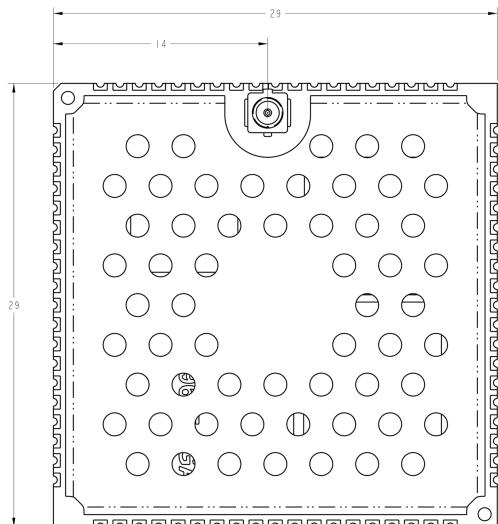

This section provides mechanical dimensions and host PCB footprint guidance for the Digi SMTplus™ (patent-pending) form factor of the ConnectCore 6UL module.

### Dimensions

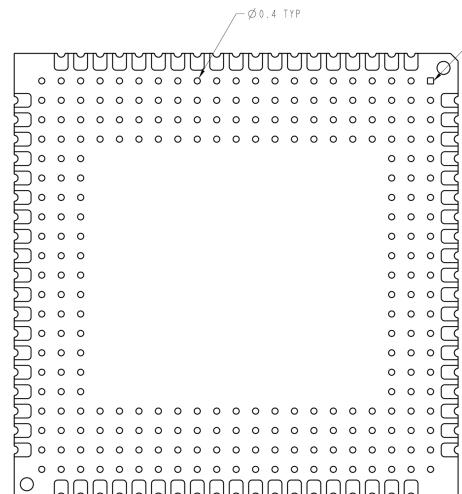

Note that all dimensions are in millimeters.

*Module specifications*

*Mechanical specifications*

TOP

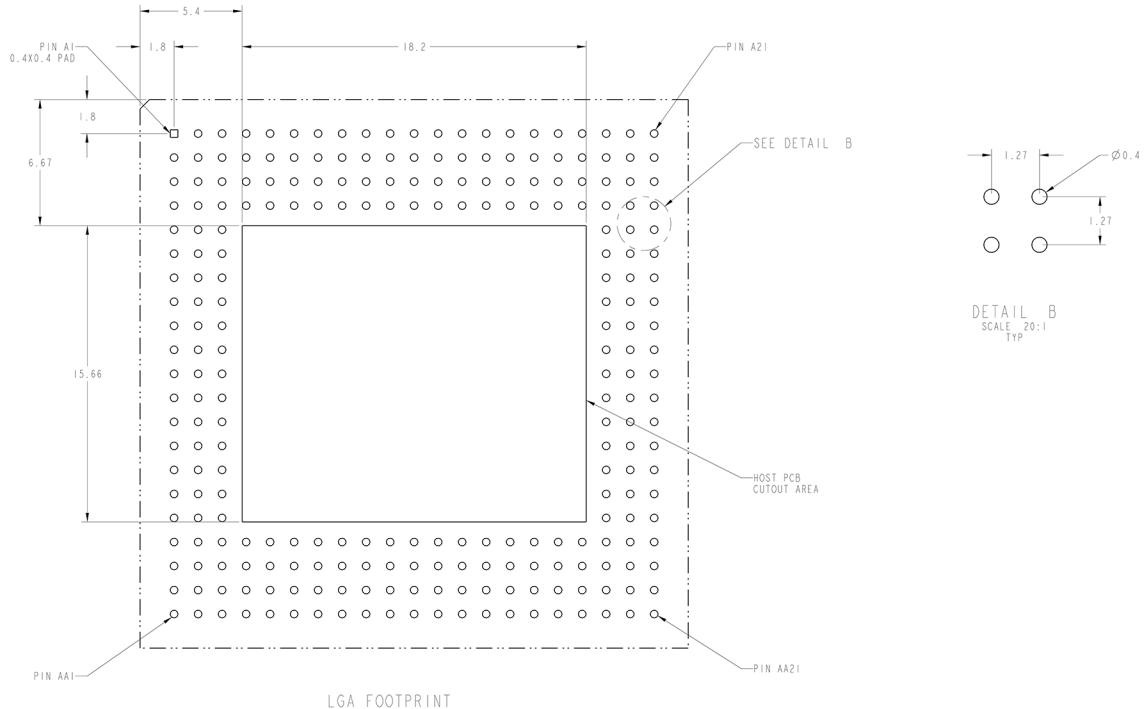

BOTTOM

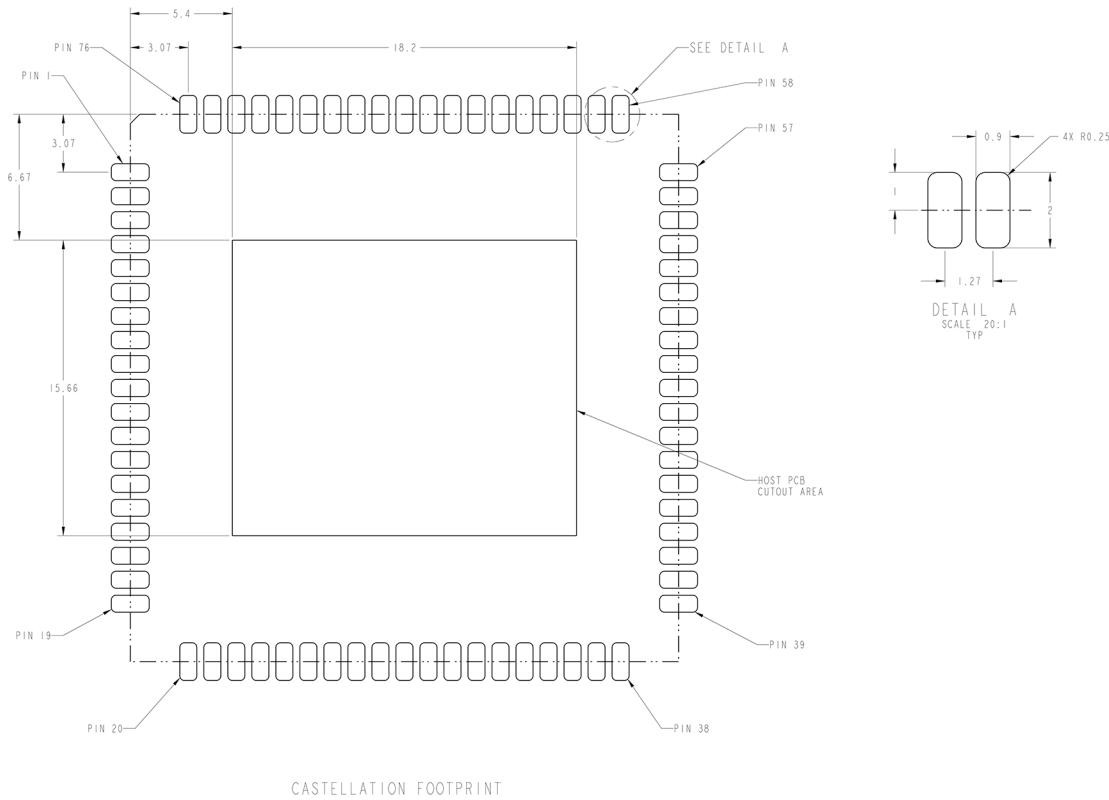

## Host PCB footprint

### Digi SMTplus™ LGA mounting

### Digi SMTplus™ Castellated Edge Via mounting

### Weight

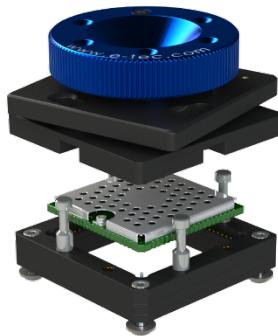

The weight of the ConnectCore 6UL module (with Wi-Fi/BT networking and shield) is 6.45g.

### Environmental specifications

- Operating temperature: -40 to 85C.
- The ConnectCore 6UL module shall be built in an enclosure so that the shield is not accessible to the end-user.

### Socket options

For testing, prototyping, and other primarily development-related purposes, Digi International and E-tec Interconnect AG have developed sockets allowing the easy insertion and removal of modules in a carrier board design. Socket models for both LGA and castellated via use cases are available.

All drawings, user instructions, schematics, and PCB footprints are posted on the [ConnectCore 6UL technical support website](#).

---

**Note** The ConnectCore 6UL SBC Express (Digi P/N CC-WMX6UL-START) has been designed to support a LPF076-1290-19AB55L socket, and can be used as a reference design.

---

All sockets are sold and built by E-tec Interconnect AG ([www.e-tec.com](http://www.e-tec.com)). The table below provides an overview of the available part numbers.

Socket model	E-tec part number
ConnectCore 6UL Castellated Vias	LPF076-1290-19AB55L
ConnectCore 6UL LGA	LPF245-1270-21AB55A + MGS245-SB01-21A9512

---

**Note** Please direct all socket-related purchase inquiries to E-tec Interconnect AG ([info@e-tec.com](mailto:info@e-tec.com)).

## Moisture sensitivity and shelf life

1. The ConnectCore 6UL module is classified as a Level 3 Moisture Sensitive Device in accordance with IPC/JEDEC J-STD-020.
2. Calculated shelf life in sealed packaging: 12 months at <40°C and <90% relative humidity (RH).
3. Environmental condition during production: 30°C /60% RH according to IPC/JEDEC J-STD -033C, paragraph 5.
4. Maximum time between opening of the sealed packaging and reflow process must not exceed 168 hours, based on condition b), IPC/JEDEC J-STD -033C, paragraph 5.2.
5. Baking is required, if conditions b) or c) do not apply. See above.
6. Baking is required, if the packaging humidity indicator indicates 10% RH or higher.
7. If baking is required, bake modules in trays 4-6 hours at 125°C; maximum stacking height is 10 trays.

## Mounting

The ConnectCore 6UL module has been designed with easy integration into existing SMT processes in mind. This section contains guidance for mounting the module on your carrier board.

The module can be configured and mounted in a Castellation OR Land Grid Array (LGA) form.

Modules are also not sealed and therefore they should not be subjected to a wash cycle or similar treatment where condensation could occur. Contact Digi International for additional guidance to discuss conformal coating approaches and options, if needed. The module is built with a No-Clean flux solder paste. The module is provided to the user clean.

The following solder paste type has been approved for mounting the module on a carrier board:

- SAC305 (Lead-free: Alpha OM-340 Type 4 or equivalent). This is a No-Clean Flux solder paste.

## Solder paste print

The following solder paste printing parameters are recommended:

- Stencil thickness: 0.100 mm / 4 mil
- Stencil diameter: One to one of pad diameter (to +20% of pad)
- Paste alignment: 20% off the pad max (offset <20% pad diameter)

## Stencil

For both castellation AND LGA applications, Digi recommends you use a laser cut and/or electro-formed stencil for placing the ConnectCore 6UL module. Based on the actual coplanarity characteristics of your carrier board, adjustments may be required to determine the optimal solder paste volume. It is also recommended to perform an X-ray analysis of the initial production run of your assembly with the ConnectCore 6UL module. Please contact Digi for additional support.

## Coplanarity

The coplanarity measured on the ConnectCore 6UL module is <0.003" bow and twist (98% confidence interval). It is important that the carrier board is also coplanar. If the carrier board is thinner than the

ConnectCore 6UL module it is recommended that the assembly be supported during the reflow process, i.e. reflow fixture should be used to minimize the potential bow of the carrier card.

## SMT pick and place

- Placement nozzle: Largest available on the machine.
- Nozzle Pick Surface: Center of shield on i.MX6UL SoM.
- Placement Speed: Slowest speed for the machine.
- Placement alignment: 10% of pad diameter (compensating for module weight and supporting alignment). The module should be placed last as part of the assembly/mounting process to eliminate unexpected shifting.

## SMT process parameter reference - for both castellation and LGA applications

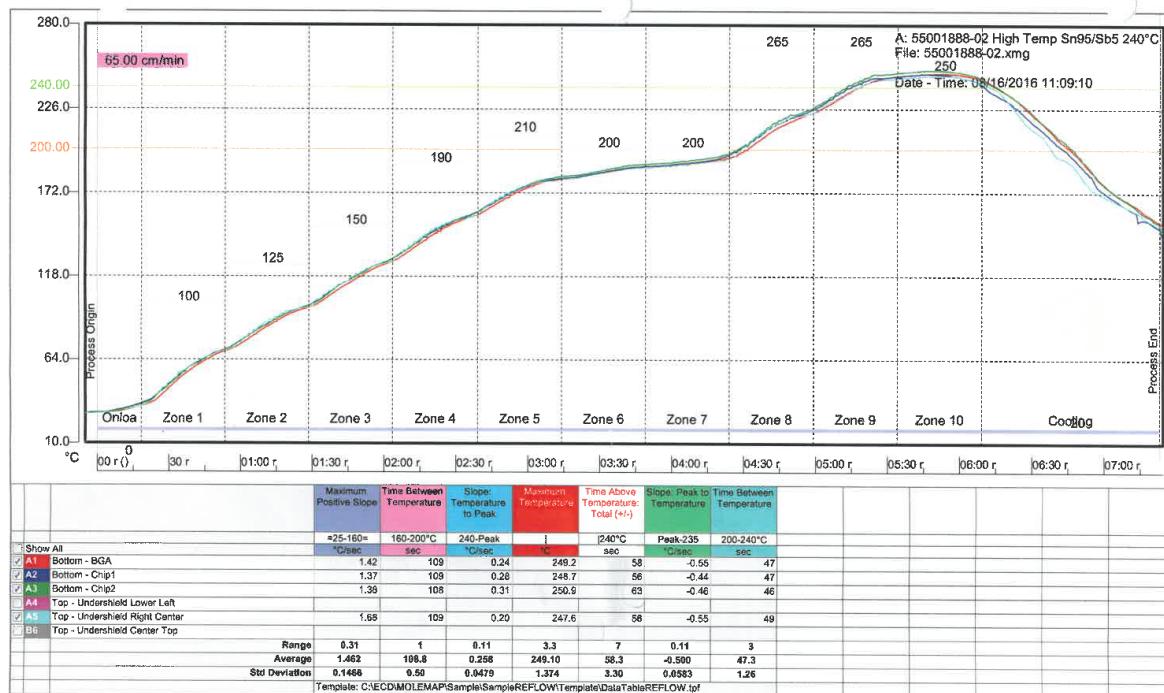

Process	SMT process	Specification recommendations
Screen Print	Solder paste	SAC 305 No-Clean (Alpha OM-340 or equivalent)
	Stencil thickness	0.100mm / 4mil
	Recommended aperture size	0.55mm / 22mil rounded square (LGA) 1:1 with pad (castellation)
	Paste alignment	20% maximum off center of the pad
PnP	Placement nozzle	Largest available on machine
	Nozzle pick surface	Shield center
	Speed	Slowest possible with PnP machine
	Placement sequence	Last, if possible
	Placement alignment	10% maximum off center of pad
Reflow	See <a href="#">Reflow profiles using a ten-zone oven, SAC 305 lead-free solder paste (Alpha OM-340)</a> .	

## Reflow profiles using a ten-zone oven, SAC 305 lead-free solder paste (Alpha OM-340)

- Recommend to keep SOM below 238°C during the reflow cycle for castellation AND LGA applications
- Time Above Liquidous (TAL) is recommended to be between 56 to 63 seconds.
- Use of 40AWG K-type thermocouple and M.O.L.E or equivalent thermal profiler is recommended.

- For castellation applications, only one thermal couple is required. Digi recommends it is located on a ground pad castellation.
- For LGA applications, two thermocouples should be used: one located on the outer-most row and a second located near the underside center of the SOM to ensure SOM is not exposed to excessive temperatures.

The following image shows the reflow profile based on a ten-zone convection oven.

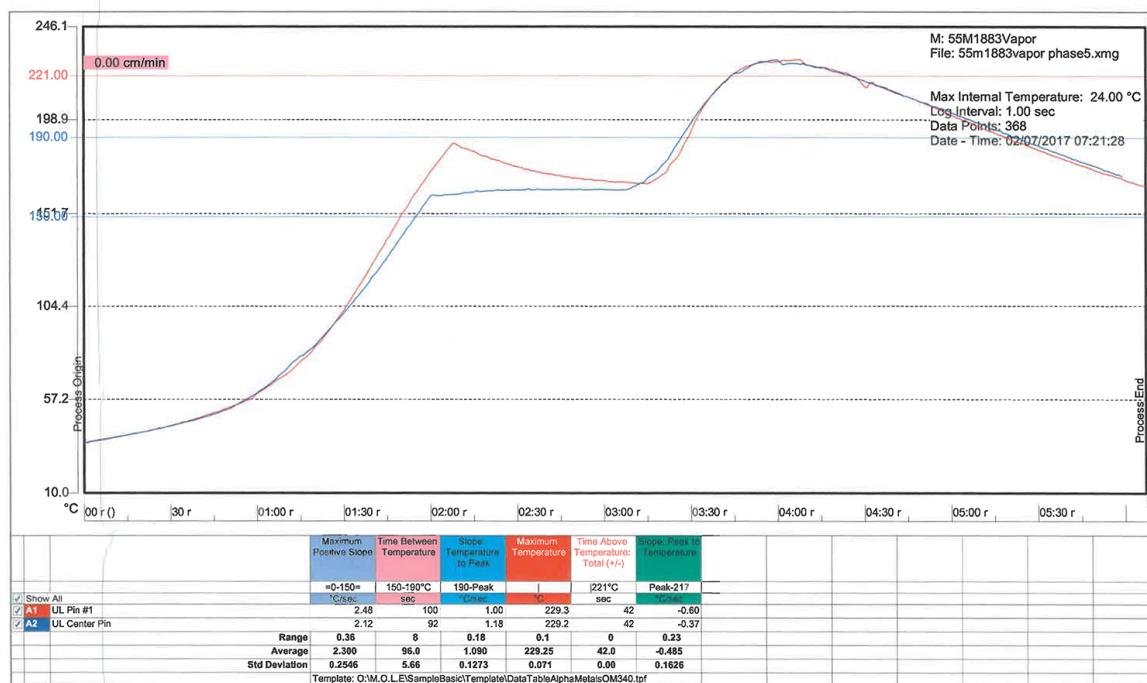

The reflow profile shown above is valid for the combination solder paste/reflow machine and Digi reference carrier board. Optimization of a reflow profile will depend on the selected solder paste/reflow machine (reflow or vapor phase) and carrier board design.

The ConnectCore 6UL module is approved to withstand a total of four (4) reflow cycles. Two (2) reflow cycles are required for manufacturing the ConnectCore 6UL module. Two (2) reflow cycles are remaining for mounting the module on the carrier board. Digi strongly recommends soldering the ConnectCore 6UL module during the last reflow cycles of the carrier board manufacturing process.

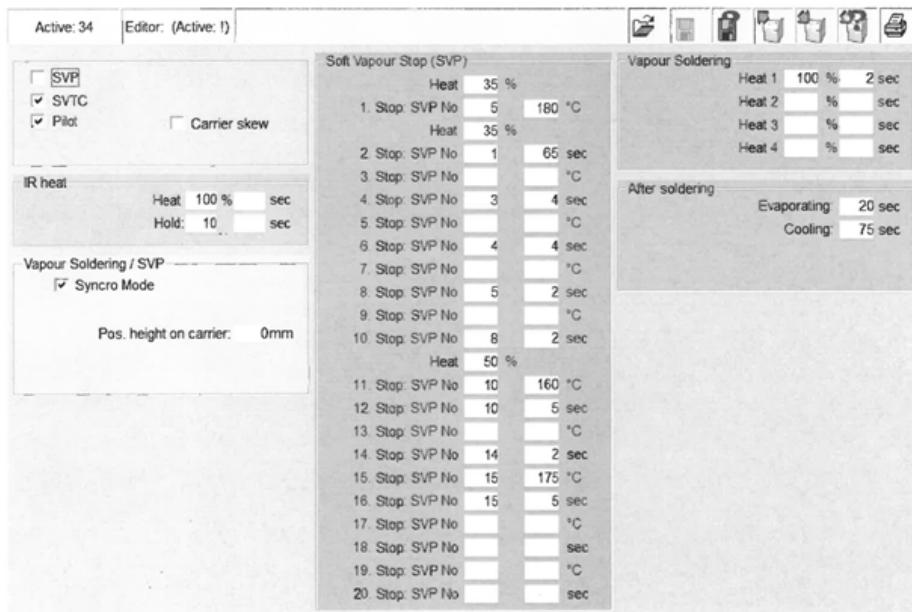

## Vapor Phase Profile Recommendation Using IBL 309 Batch Soldering Machine, SAC 305 Lead-Free Solder Paste (Alpha OM-340)

- Recommend to keep SOM below 235°C during the reflow cycle for castellation AND LGA applications:
  - This is controlled by the Solvay Plastics, Galden XS230 vapor fluid; maximum soldering temperature 230C for unleaded solder.

- Vapor Phase heat transfers faster than reflow meaning Time Above Liquidous (TAL) is shorter. Digi recommends TAL to be between 40 and 45 seconds.
- Use of 40AWG K-type thermocouple and M.O.L.E or equivalent thermal profiler is recommended.
- For castellation applications, only one thermal couple is required recommended to be location on a ground pad castellation.
- For LGA applications, two thermocouples should be used. One located on the outer most row and a second location should be near the underside center of the SoM to ensure SoM is not exposed to excessive temperatures
- Solder Pallet shall be used that can be processed through screen print, Pick & Place and vapor phase.

## Vapor Phase IBL 309 batch soldering machine settings

## Conformal coating

The ConnectCore 6UL module may be conformally coated using an IPC-CC-830 compliant Acrylic (Type AR) coating material. The material shall be applied by spray application IPC-A-610. DIP coating is method shall not be used. If other coating material is required Urethane (Type UR), Silicone (Type SR) or Epoxy (Type ER) please contact Digi.

## Certifications

---

External antenna .....	134
United States FCC .....	134
Europe .....	136
Canada (IC) .....	136
Japan .....	138

## External antenna

In order to reuse the FCC and IC modular approval of the ConnectCore 6UL module when using the external antenna connected to pad B13 (RF\_ANT\_EXT), the exact same circuitry as in the schematics and PCB routing of the ConnectCore 6UL SBC PRO must be used. Exact routing information can be found on the product support page in the section Design Documents / ConnectCore 6UL SBC Project (ALTIUM). In this document, you can find the corresponding PCB material used, trace width and length.

## United States FCC

The ConnectCore 6UL module complies with Part 15 of the FCC rules and regulations. Compliance with the labeling requirements, FCC notices and antenna usage guidelines is required. To fulfill FCC Certification, the OEM must comply with the following regulations:

The system integrator must ensure that the text on top side of the module is placed on the outside of the final product.

ConnectCore 6UL module may only be used with antennas approved. See [FCC-approved antennas](#).

**WARNING!** The Original Equipment Manufacturer (OEM) must ensure that FCC labeling requirements are met. This includes a clearly visible label on the outside of the final product enclosure that displays the contents shown below. Required FCC Label for OEM products containing the ConnectCore 6UL module.

### Contains FCC ID: MCQ-CCIMX6UL

This device complies with part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.

## FCC notices

**IMPORTANT:** The ConnectCore 6UL module has been certified by the FCC for use with other products without any further certification (as per FCC section 2.1091). Modifications not expressly approved by Digi could void the user's authority to operate the equipment.

**IMPORTANT:** OEMs must test final product to comply with unintentional radiators (FCC section 15.107 & 15.109) before declaring compliance of their final product to Part 15 of the FCC Rules.

**IMPORTANT:** The ConnectCore 6UL module has been certified for remote and base radio applications. If the module will be used for portable applications, the device must undergo SAR testing. This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy, and if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: Re-orient or relocate the receiving antenna, Increase the separation between the equipment and receiver, Connect equipment and receiver to outlets on different circuits, or Consult the dealer or an experienced radio/TV technician for help.

**IMPORTANT:** ConnectCore 6UL module is for professional (OEM) installation only.

## FCC-approved antennas

The ConnectCore 6UL module can be installed utilizing antennas and cables constructed with non-standard connectors (RPSMA, RPTNC, and so on).

The modules are FCC approved for fixed base station and mobile applications for the channels indicated in the tables below. If the antenna is mounted at least 20cm (8 in.) from nearby persons, the application is considered a mobile application. Antennas not listed in the table must be tested to comply with FCC Section 15.203 (Unique Antenna Connectors) and Section 15.247 (Emissions).

The antennas in the tables below have been approved for use with this module. Digi does not carry all of these antenna variants. Contact Digi Sales for available antennas.

### ***Antennas approved for use with the ConnectCore 6UL Wi-Fi modules***

Part number	Type (description)	Peak gain 2.4 GHz	Peak gain 5 GHz
Linx Technologies Inc. ANT-DB1-RAF-RPS	Dipole, articulated RPSMA, dual band 2.4 GHz & 5 GHz	2.5	4.6
Ethertronics 1001932	PCB antenna, dual band 2.4 GHz & 5 GHz	2.5	4.4
Yageo ANTX100P001B24553	PCB antenna, dual band 2.4 GHz & 5 GHz	4.6	5.1

---

**Note** If using the RF module in a portable application (for example - if the module is used in a hand-held device and the antenna is less than 20cm from the human body when the device is in operation): The integrator is responsible for passing additional SAR (Specific Absorption Rate) testing based on FCC rules 2.1091 and FCC Guidelines for Human Exposure to Radio Frequency Electromagnetic Fields, OET Bulletin and Supplement C. The testing results will be submitted to the FCC for approval prior to selling the integrated unit. The required SAR testing measures emissions from the module and how they affect the person.

---

**Note** When using Linx Technologies Inc. ANTDB1-RAF-RPS antenna, make sure to use a cable of minimum 10cm long and of type RG-178.

## RF exposure

---

**CAUTION!** To satisfy FCC RF exposure requirements for mobile transmitting devices, a separation distance of 20 cm or more should be maintained between the antenna of this device and persons during device operation. To ensure compliance, operations at closer than this distance are not recommended. The antenna used for this transmitter must not be co-located in conjunction with any other antenna or transmitter. The preceding statement must be included as a CAUTION statement in OEM product manuals in order to alert users of FCC RF Exposure compliance.

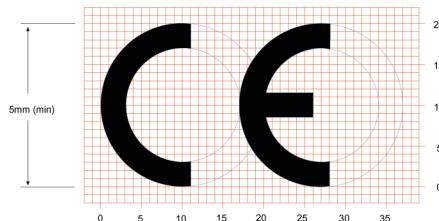

## Europe

- 2.412 to 2.472 GHz; 13 channels
- 5.180 to 5.320 GHz; 8 channels
- 5.500 to 5.700 GHz, 8 channels (excludes 5.600 to 5.640 GHz)

### OEM labeling requirements

The **CE** marking must be affixed to a visible location on the OEM product.

### CE labeling requirements

The CE mark shall consist of the initials **CE** taking the following form:

- If the CE marking is reduced or enlarged, the proportions given in the above graduated drawing must be respected.
- The CE marking must have a height of at least 5mm except where this is not possible on account of the nature of the apparatus.
- The CE marking must be affixed visibly, legibly, and indelibly.

### Declarations of Conformity

Digi has issued Declarations of Conformity for the ConnectCore 6UL system-on-module concerning emissions, EMC, and safety. For more information, see <http://www.digi.com/resources/certifications>.

#### Important note

Digi customers assume full responsibility for learning and meeting the required guidelines for each country in their distribution market. Refer to the radio regulatory agency in the desired countries of operation for more information.

### Approved antennas

The same antennas have been approved for Europe as stated in the FCC table for use with the ConnectCore 6UL module.

## Canada (IC)

**IC:** 1846A-CCIMX6UL

**PMN:** CC IMX6UL

**HVIN:** ConnectCore 6UL

This device complies with Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes : (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

## Labeling requirements

Labeling requirements for Industry Canada are similar to those of the FCC. A clearly visible label on the outside of the final product enclosure must display the following text:

*Contains Model ConnectCore™ for i.MX6UL Radio, IC: 1846A-CCIMX6UL*

The Product Marketing Name (PMN) of the product is: CC IMX6UL.

## Transmitters with detachable antennas

This radio transmitter (IC: 1846A-CCIMX6UL) has been approved by Industry Canada to operate with the antenna types listed in the table above with the maximum permissible gain and required antenna impedance for each antenna type indicated. Antenna types not included in this list, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Le présent émetteur radio (IC: 1846A-CCIMX6UL) a été approuvé par Industrie Canada pour fonctionner avec les types d'antenne énumérés ci-dessous et ayant un gain admissible maximal et l'impédance requise pour chaque type d'antenne. Les types

d'antenne non inclus dans cette liste, ou dont le gain est supérieur au gain maximal indiqué, sont strictement interdits pour l'exploitation de l'émetteur.

Under Industry Canada regulations, this radio transmitter may only operate using an antenna of a type and maximum (or lesser) gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

Conformément à la réglementation d'Industrie Canada, le présent émetteur radio peut fonctionner avec une antenne d'un type et d'un gain maximal (ou inférieur) approuvé pour l'émetteur par Industrie Canada. Dans le but de réduire les risques de brouillage radioélectrique à l'intention des autres utilisateurs, il faut choisir le type d'antenne et son gain de sorte que la puissance isotrope rayonnée équivalente (p.i.r.e.) ne dépasse pas l'intensité nécessaire à l'établissement d'une communication satisfaisante.

ConnectCore 6UL module is for professional (OEM) installation only.

Le module ConnectCore 6UL doit impérativement être installé par un professionnel (OEM).

## RF exposure

---

To satisfy Industry Canada RF exposure requirements, a separation distance of 20 cm or more should be maintained between the antenna of this device and persons during device operation.

Pour satisfaire aux exigences d'Industrie Canada concernant l'exposition RF, une distance égale ou supérieure à 20cm doit être respectée entre les antennes de ce produit et les personnes se trouvant à proximité.

---

**The preceding statement must be included as a CAUTION statement in OEM product manuals in order to alert users of Industry Canada RF Exposure compliance.**

**Cette information doit être incluse dans le manuel du produit OEM afin d'alerter les utilisateurs sur la nécessité de respecter l'exposition RF d'Industrie Canada.**

## Approved antennas

The same antennas have been approved for Canada as stated in the FCC table for use with the ConnectCore 6UL module.

## Japan

電波法により5GHz帯は屋内使用に限ります。

This device has been granted a designation number by Ministry of Internal Affairs and Communications according to:

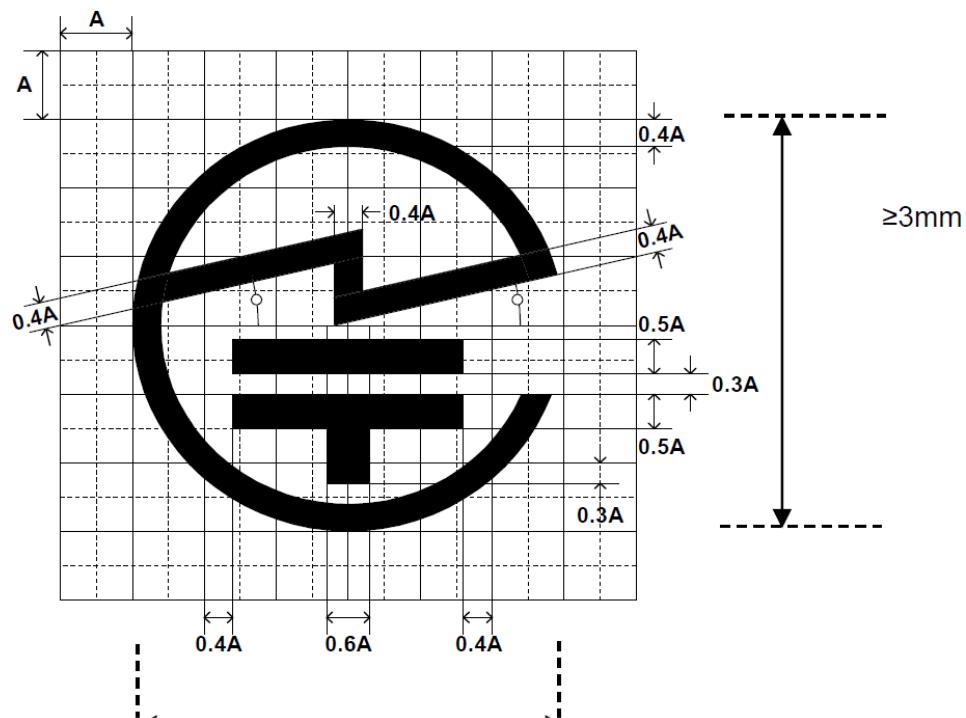

Ordinance concerning Technical Regulations Conformity Certification etc. of Specified Radio Equipment (特定無線設備の技術基準適合証明等に関する規則).

- Article 2, Paragraph 1, Item 19, 19-3, 19-3-2 Category: WW, XW, YW
- Model/Name of equipment: ConnectCore 6UL
- Radio label marking:
  - R: 202-LSF056
  - T: D 17-0014 202

This device should not be modified (otherwise the granted designation number will be invalid).

- 2.412 to 2.472 GHz; 13 channels
- 5.180 to 5.320 GHz; 8 channels
- 5.500 to 5.700 GHz; 11 channels

## **Approval Label (MIC Marking)**
