1.3 - LS Research, LLC Test Facility

LS Research, LLC is accredited by A2LA (American Association for Laboratory Accreditation) as conforming to ISO/IEC 17025, 2005 "General Requirements for the Competence of Calibration and Testing Laboratories".

LS Research, LLC's scope of accreditation includes all test methods listed herein, unless otherwise noted. Accreditation status can be verified at A2LA's web site: www.a2la2.net.

1.4 - Location of Testing

All testing was performed at the following location utilizing the facilities listed below, unless otherwise noted.

LS Research, LLC
W66 N220 Commerce Court
Cedarburg, Wisconsin, 53012 USA,

List of Facilities Located at LS Research, LLC:

Semi-Anechoic Chamber

1.5 - Test Equipment Utilized

A complete list of equipment utilized in testing is provided in Appendix A of this test report. Calibration dates are indicated in Appendix A. All test equipment is calibrated by a calibration laboratory accredited to the requirements of ISO/IEC 17025, and traceable to the SI standard.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

EXHIBIT 2. PERFORMANCE ASSESSMENT

2.1 – Client Information

Manufacturer Name:	LSR
Address:	W66 N220 Commerce Court, Cedarburg, WI 53012
Contact Name:	Josh Bablitch

2.2 - Equipment Under Test (EUT) Information

The following information has been supplied by the applicant.

Product Name:	Sterling-LWB
Model Number:	Sterling-LWB
Serial Number:	Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26

2.3 - Associated Antenna Description

The antennas associated with the EUT are:

1. Johanson Technology high frequency ceramic chip antenna, part number 2450AT18D0100. The chip antenna has a peak gain of 1.5dBi.
2. LSR 2.4 GHz FlexPIFA antenna. Part number 001-0014 with a peak antenna gain of 2.0 dBi.
3. LSR 2.4 GHz FlexNotch antenna. Part number 001-0015 with peak antenna gain of 2.0 dBi.
4. LSR 2.4 GHz Dipole antenna. Part number 001-0010 with peak antenna gain of 2.0 dBi.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

2.4 - EUT'S Technical Specifications

EUT Frequency Range (in MHz)	2412MHz – 2462MHz (WLAN)
RF Power in Watts (Conducted measurement)	
Minimum:	2.4GHz WLAN 802.11 b: 0.0537watts 802.11 g: 0.1820watts 802.11 n (HT20): 0.1202watts 2.4 GHz BLE: 0.0045watts
Maximum:	2.4GHz WLAN 802.11 b: 0.1023watts 802.11 g: 0.2519watts 802.11 n (HT20): 0.21877watts 2.4 GHz BLE: 0.0056watts
Conducted Output Power, peak (in dBm)	2.4GHz WLAN 802.11 b: Maximum = 20.05dBm Minimum = 17.31dBm 802.11 g: Maximum = 24.00dBm Minimum = 22.64dBm 802.11 n (HT20): Maximum = 23.38dBm Minimum = 20.77dBm 2.4 GHz BLE : Maximum = 7.5dBm Minimum = 6.5dBm
Field Strength at 3 meters (Maximum)	Not Applicable
99% Bandwidth	2.4GHz WLAN: 802.11 b: 13.99MHz 802.11 g: 16.62MHz 802.11 n (HT20): 17.69MHz 2.4GHz BLE: 1.09MHz
Type of Modulation	OFDM (WLAN), DSSS(WLAN), GFSK (BLE)
Occupied Bandwidth (6dB BW)	2.4GHz WLAN: 802.11 b: 10MHz 802.11 g: 16.0MHz 802.11 n (HT20): 16.3MHz 2.4 GHz BLE: 727.0kHz
Transmitter Spurious (worst case) at 3 meters	49.4dB μ V/m at 7386MHz , Peak
Frequency Tolerance %, Hz, ppm	Better than 100 ppm

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

Transceiver Model #	Transceiver: SPIL SB-WB-N08
Antenna Information	
Detachable/non-detachable	Non-detachable
Type	Ceramic chip antenna
Gain	Peak Gain in 2.4GHz band = 1.5 dBi
Detachable/non-detachable	Detachable
Type	Dipole
Gain	Peak Gain in 2.4GHz band = 2.0 dBi
EUT will be operated under FCC Rule Part(s)	Title 47 part 15.247
EUT will be operated under RSS Rule Part(s)	RSS 247
Modular Filing	☒ Yes ☐ No

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

2.5 - Product Description

The Sterling-LWB is a multi-standard module with support for WLAN (802.11 b/g/n), and Bluetooth V2.1 and Bluetooth 4.0 & 4.1 with multiple antenna options.

Chip Antenna: Johanson Part # 2450AT18D0100 Peak Gain 1.5 dBi

U.FL Antenna port utilizes the following antenna options:

LSR 2.4 GHz Dipole Antenna 2dBi

LSR 2.4 GHz FlexPIFA 2dBi

LSR 2.4 GHz FlexNotch 2dBi

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

EXHIBIT 3. EUT OPERATING CONDITIONS & CONFIGURATIONS DURING TESTS

3.1 - Climate Test Conditions

Temperature:	70 -71° F
Humidity:	32-44%
Pressure:	728-741mmHg

3.2 - Applicability & Summary Of EMC Emission Test Results

FCC and IC Paragraph	Test Requirements	Compliance (Yes/No)
FCC : 15.207 IC : RSS GEN sect. 8.8	Power Line Conducted Emissions Measurements	Yes
FCC : 15.247(b) & 1.1310 2.1046 IC : RSS 247 5.4	Maximum Output Power	Yes
FCC : 15.247(i), 1.1307, 1.1310, 2.1091 & 2.1093 IC : RSS 102	RF Exposure Limit	Yes
FCC :15.247(d) IC : RSS 247 5.5	RF Conducted Spurious Emissions at the Transmitter Antenna Terminal	Yes
FCC:15.247 (a)(2) IC: RSS 247 5.2	6 dB Bandwidth of a Digital Modulation System	Yes
FCC:15.247 (e) IC: RSS 247 5.2	Power Spectral Density of a Digital Modulation System	Yes
FCC : 15.247(c), 15.209 & 15.205, 2.1053 IC : RSS GEN 8.9, 8.10	Transmitter Radiated Emissions in the restricted bands	Yes

3.3 - Modifications Incorporated In The EUT For Compliance Purposes

☒ None ☐ Yes (explain below)

3.4 - Deviations & Exclusions From Test Specifications

☒ None ☐ Yes (explain below)

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

EXHIBIT 4. DECLARATION OF CONFORMITY

The EUT was found to MEET the requirements as described within the specification of FCC Title 47, CFR Part 15.247, and Industry Canada RSS-247, Issue 1.

Note: If some emissions are seen to be within 3 dB of their respective limits; as these levels are within the tolerances of the test equipment and site employed, there is a possibility that this unit, or a similar unit selected out of production may not meet the required limit specification if tested by another agency.

LS Research, LLC certifies that the data contained herein was taken under conditions that meet or exceed the requirements of the test specifications. The results in this Test Report apply only to the item(s) tested on the above-specified dates. Any modifications made to the EUT subsequent to the indicated test date(s) will invalidate the data herein, and void this certification.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

EXHIBIT 5. UNWANTED EMISSIONS INTO THE RESTRICTED FREQUENCY BANDS.

5.1 - Test Setup

The test setup was assembled in accordance with Title 47, CFR FCC Part 15, RSS GEN and ANSI C63.10-2013. The EUT was placed on an 80cm high non-conductive pedestal below 1 GHz and 150cm non-conductive pedestal above 1 GHz, centered on a flush mounted turntable inside a 3 meter Semi-Anechoic, FCC listed Chamber. The EUT was operated in continuous transmit mode for final testing using power as provided by a DC power supply that is sold separately from EUT. The unit has the capability to operate on 11 WLAN channels and 40 BLE channels, controllable via proprietary software provided by the manufacturer.

The applicable limits apply at a 3 meter distance. The calculations to determine these limits are detailed in the following pages. Please refer to Appendix A for a complete list of test equipment. The test sample was operated on one of three (3) standard channels to comply with FCC Part 15.31(m).

5.2 - Test Procedure

Radiated RF measurements were performed on the EUT in a 3 meter Semi-Anechoic, FCC listed Chamber. The frequency range from 30 MHz to 25000 MHz was scanned and investigated. The radiated RF emission levels were manually noted at the various fixed degree settings of azimuth on the turntable and antenna height. The EUT was placed on a non-conductive pedestal in the 3 meter Semi-Anechoic Chamber, with the antenna mast placed such that the antenna was 3 meters from the EUT. A Biconical Antenna was used to measure emissions from 30 MHz to 200 MHz, and a Log Periodic Antenna was used to measure emissions from 200 MHz to 1000 MHz. A Double-Ridged Waveguide Horn Antenna was used from 1 GHz to 18 GHz while a standard gain horn antenna was used in the 18 GHz to 25 GHz range. The maximum radiated RF emissions between 30MHz to 25 GHz were found by raising and lowering the sense antenna between 1 and 4 meters in height, using both horizontal and vertical antenna polarities and ensuring that the EUT was within the cone of radiation of the receive antenna.

The EUT was positioned in 3 orthogonal orientations.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

5.3 - Test Equipment Utilized

A list of the test equipment and antennas utilized for the Radiated Emissions test can be found in Appendix A. This list includes calibration information and equipment descriptions. All equipment is calibrated and used according to the operation manuals supplied by the manufacturers. All calibrations of the antennas used were performed at a calibration laboratory accredited to ISO 17025, and are traceable to the SI standard. In addition, the Connecting Cables were measured for losses using a calibrated Signal Generator and an EMI Receiver. The resulting correction factors and the cable loss factors from these calibrations were entered into the EMI Receiver database. As a result, the data taken from the EMI Receiver accounts for the antenna correction factor as well as cable loss or other corrections, and can therefore be entered into the database as a corrected meter reading. The EMI Receiver was operated with a resolution bandwidth of 120 kHz for measurements below 1 GHz (video bandwidth of 1.2 MHz) using quasi-peak detector, and a bandwidth of 1 MHz for measurements above 1 GHz (video bandwidth of 3 MHz) for Peak measurements using a Peak detector. Average measurements were performed using an average detector using 1MHz bandwidth (video bandwidth of 3MHz)

5.4 - Test Results

The EUT was found to **MEET** the Radiated Emissions requirements of Title 47 CFR, FCC Part 15.247 and Canada RSS-247, Issue 1, for a DTS transmitter. The frequencies with significant RF signal strength were recorded and plotted as shown in the Data Charts and Graphs.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

5.5 - Calculation of Radiated Emissions Limits and reported data.

Reported data:

For both fundamental and spurious emissions measurement, the data reported includes all necessary correction factors. These correction factors are loaded onto the EMI receiver when measurements are performed.

Reported Measurement data = Raw receiver measurement (dB μ V/m) + Antenna correction Factor + Cable factor (dB) + Miscellaneous factors when applicable (dB) – amplification factor when applicable (dB).

Generic example of reported data at 200 MHz:

Reported Measurement data = 18.2 (raw receiver measurement) + 15.8 (antenna factor) + 1.45 (cable factor) = 35.45 (dB μ V/m).

As specified in 15.247 (d), radiated emissions that fall within the restricted band described in 15.205(c), must comply with the general emissions limit.

The following table depicts the general radiated emission limits above 30 MHz. These limits are obtained from Title 47 CFR, Part 15.209, for radiated emissions measurements. These limits were applied to any signals found in the 15.205 restricted bands. The mentioned limits correspond to those limits listed in RSS GEN.

Frequency (MHz)	3 m Limit μ V/m	3 m Limit (dB μ V/m)	1 m Limit (dB μ V/m)
30-88	100	40.0	-
88-216	150	43.5	-
216-960	200	46.0	-
960-40,000	500	54.0	63.5

Sample conversion of field strength (μ V/m to dB μ V/m):

$\text{dB}\mu\text{V/m} = 20 \log_{10} (100) = 40 \text{ dB}\mu\text{V/m}$ (from 30-88 MHz)

Per KDB 558074 section 10, an EIRP measurement can be converted to field strength using this relationship:

$\text{EIRP} = E$ (electric field strength in dB μ V/m) + $20\log(d)$ -104.8

$E = \text{EIRP} - 20\log(d) + 104.8$

Sample conversion:

For EIRP = -56.6 dBm,

E (dB μ V/m) = -56.6 – $20\log(3\text{m})$ + 104.8 = 38.7 dB μ V/m

For EIRP = -60.9 dBm,

E (dB μ V/m) = -60.9 – $20\log(3\text{m})$ + 104.8 = 34.4 dB μ V/

5.7 – Screen Captures.

The screen captures below are those using the Peak detector of the analyzer. In addition, the screen captures presented are those which were deemed to be an appropriate representation of the spectrum scan.

WLAN Chip:

30 to 200 MHz, 3m distance.

Note: Emissions seen above are not a function of the EUT but is of the power supply used.

200 to 1000 MHz, 3m distance.

Note: Emissions seen above are not a function of the EUT but is of the power supply used.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

1000 to 2310 MHz, 3m distance.

2310 to 2390 MHz, 3m distance.

Notes:

1. The plot above taken when EUT was in IEEE 802.11g mode and represents worst case. IEEE 802.11b and IEEE 802.11n modes were tested.
2. Table below shows points on the plot of the maximum emission:

Peak Frequency (MHz)	Peak (dBμV/m)	Peak Limit (dBμV/m)	Peak Margin (dB)	Average Frequency (MHz)	Average (dBμV/m)	Average Limit (dBμV/m)	Average Margin (dB)
2390.00	72.53	74.00	1.47	2390.00	51.64	54.00	2.36

EXHIBIT 6. CONDUCTED EMISSIONS TEST, AC POWER LINE

6.1 Test Setup

The test area and setup are in accordance with ANSI C63.4 and with Title 47 CFR, FCC Part 15, Industry Canada RSS GEN. The EUT was placed on a non-conductive table, with a height of 80 cm above the reference ground plane. The power supply was then plugged into a 50Ω (ohm), Line Impedance Stabilization Network (LISN). An “off the shelf” AC-DC adapter provided a 3.3VDC supply via an appropriate broadband EMI Filter, and then to the LISN line input. Final readings were then taken and recorded. Final readings were then taken and recorded. After the EUT was setup and connected to the LISN, the RF Sampling Port of the EMI receiver System. The LISN used has the ability to terminate the unused port with a 50Ω (ohm) load when switched to either L1 (line) or L2 (neutral).

6.2 Test Procedure

The EUT was investigated in continuous modulated transmit mode for this portion of the testing. The appropriate frequency range and bandwidths were selected on the EMI Receiver, and measurements were made. The bandwidth used for these measurements is 9 kHz, as specified in CISPR 16-1, Section 1, Table 1, for Quasi-Peak and Average detectors in the frequency range of 150 kHz to 30 MHz. Final readings were then taken and recorded.

6.3 Test Equipment Utilized

A list of the test equipment and accessories utilized for the Conducted Emissions test is provided in Appendix A. This list includes calibration information and equipment descriptions. All equipment is calibrated and used according to the operation manuals supplied by the manufacturers. Calibrations of the LISN and Limiter were performed at an IEC/ISO 17025 accredited calibration laboratory, traceable to the SI standard. All cables are calibrated and checked periodically for conformance. The emissions are measured on the EMI System, which has automatic correction for all factors stored in memory and allows direct readings to be taken.

6.4 Test Results

The EUT was found to **MEET** the Conducted Emission requirements of FCC Part 15.207 and RSS GEN 7.2.4 for Conducted Emissions for an Intentional Radiator. See the Data Charts and Graphs for more details of the test results.

EXHIBIT 7. OCCUPIED BANDWIDTH

Test Engineer(s): Coty Hammerer

7.1 - Limits

For a DTS system operating in the 2400 to 2483.5 MHz band, the 6dB emission bandwidth limit is 500 kHz.

7.2 - Method of Measurements

For this portion of the tests, a direct measurement of the transmitted signal was performed at the antenna port of the EUT, via a cable connection to a spectrum analyzer. An attenuator was placed in series with the cable to protect the spectrum analyzer. The loss from the cable and the attenuator were added on the analyzer as gain offset settings there by allowing direct measurements, without the need for any further corrections. The EUT was configured to run in a continuous transmit mode, while being supplied with typical data as a modulation source. A bandwidth measurement function that is built into the spectrum analyzer was used to measure the 20dB/emission bandwidth while the 6dB bandwidth was measured using **FCC OET KDB 558074 section 8 option2**.

Note:

The 20dB bandwidth was measured for use with the measurement method prescribed in FCC OET KDB 558074 for maximum conducted power.

EXHIBIT 8. BAND EDGE MEASUREMENTS

Test Engineer(s): Coty Hammerer

8.1 - Method of Measurements

FCC 15.247 requires a measurement of spurious emission levels at the restricted band to be compliant to the general emissions limit, in particular at the Band-Edges where the intentional radiator operates. The EUT was operated in continuous transmit mode with continuous modulation, with internally generated data as the modulating source. The EUT was operated at the lowest channel for the investigation of the lower Band-Edge, and at the highest channel for the investigation of the higher Band-Edge.

For radiated measurements, the EMI Receiver was operated with a resolution bandwidth of 120 kHz for measurements below 1 GHz (video bandwidth of 1.2 MHz) using quasi-peak detector, and a bandwidth of 1 MHz for measurements above 1 GHz (video bandwidth of 3 MHz) for Peak measurements using a Peak detector. Average measurement was performed using a Peak detector with 1MHz resolution bandwidth and 10Hz video bandwidth.

The Band-edge measurements were performed conducted (100kHz bandwidth). The measurement of band-edge was performed to satisfy FCC 15.247(d).

Per FCC KDB 558074 D01 Measurement Guidance v03r05 (section 11), conducted measurements were performed with 100 kHz bandwidth for all emissions outside of the band of operation.

Per FCC KDB 558074 D01 Measurement Guidance v03r05, section 12.2, conducted measurements were performed to supplement cabinet radiation measurements.

For both conducted and radiated measurements, correction factors and the cable loss factors were entered into the EMI Receiver database. **As a result, the plots taken from the EMI Receiver accounts for all applicable correction factor as well as cable loss, and can therefore be entered into the database as a corrected meter reading.**

8.2. Band edge screen captures.

The data presented below are samples selected from the various data rates and channels tested.

Prepared For: LSR	Model #: Sterling-LWB	Report #: 316050
EUT: Sterling-LWB	Serial #: Radiated: WLAN: 15, BLE: 29 Conducted: WLAN: 23, BLE 26	LSR Job #: C-2391

Conducted measurements to supplement cabinet radiation measurements per FCC KDB 558074 D01 Measurement Guidance v03r05 section 12.2.

Per KDB 558074 D01 v03r05 section 12.2.5.2, average power measurement procedure requires that when averaging across on and off times of the EUT (when EUT transmission is $\leq 98\%$), the measurement shall be followed with a duty cycle correction.

The data shall be corrected by adding the duty cycle correction factor:

Duty cycle correction factor = $10\log(1/x)$

X is the duty cycle.

Final measurement = Average measurement + Duty cycle correction factor.

Final band-edge measurement = Average measurement + duty cycle correction factor + antenna gain

Duty Cycle measurements:

BLE:

EXHIBIT 9. POWER OUTPUT (CONDUCTED): 15.247(b)

Test Engineer(s): Coty Hammerer

9.1 - Method of Measurements

The conducted RF output power of the EUT was measured at the antenna port using a short RF cable along with an attenuator as protection for the spectrum analyzer. The loss from the cable and the attenuator were added on the analyzer as gain offset settings there by allowing direct measurements without the need for any further corrections. The unit was configured to run in a continuous transmit mode, while being supplied with typical data as a modulation source.

Measurement procedure used was FCC OET KDB 558074 D01 Measurement Guidance v03r05 section 9.1.2 for WLAN and 9.1.1 for BLE

9.2 - Test Data

The data reported includes all necessary correction factors. These correction factors are loaded onto the EMI receiver when measurements are performed.

Reported Measurement data = Raw receiver measurement (dBm) + Cable factor (dB) + Miscellaneous factors when applicable (dB).

Generic example of reported data at 2440 MHz:

Reported Measurement data = 8.55 (raw receiver measurement in dBm) + 0.85 (cable factor in dB) = 9.4 (dBm).

EXHIBIT 10. CONDUCTED SPURIOUS EMISSIONS: 15.247(d)

Test Engineer(s): Coty Hammerer

10.1 - Limits

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 db below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement.

10.2 - Conducted Harmonic and Spurious RF Measurements

FCC Part 15.247(d) and IC RSS 210 A8.5 both require a measurement of conducted harmonic and spurious RF emission levels, as reference to the carrier level when measured in a 100 kHz bandwidth. For this test, the spurious and harmonic RF emissions from the EUT were measured at the EUT antenna port using a short RF cable along with an attenuator as protection for the spectrum analyzer. The loss from the cable and the attenuator were added on the analyzer as gain offset settings, thereby allowing direct readings of the measurements made without the need for any further corrections. A spectrum analyzer was used with the resolution bandwidth set to 100 kHz for this portion of the tests. The unit was configured to run in a continuous transmit mode, while being supplied with typical data as a modulation source. The spectrum analyzer was used with measurements from a peak detector presented in the chart below. Screen captures were acquired and any noticeable spurious and harmonic signals were identified and measured.

Measurement procedure used was FCC OET KDB 558074 D01 Measurement Guidance v03r05 section 11.

In addition, conducted measurements were performed to supplement cabinet radiation measurements and is included in this section. Measurement procedure used was **FCC KDB 558074 D01 Measurement Guidance v03r05, section 12.2.**

The data reported includes all necessary correction factors. These correction factors are loaded onto the EMI receiver when measurements are performed.

Reported Measurement data = Raw receiver measurement (dBm) + Cable factor (dB) + Miscellaneous factors when applicable (dB).

Generic example of reported data at 2440 MHz:

Reported Measurement data = 8.55 (raw receiver measurement in dBm) + 0.85 (cable factor in dB) = 9.4 (dBm).

EXHIBIT 11. POWER SPECTRAL DENSITIES: 15.247(e)

11.1 Limits

For digitally modulate systems, the power spectral density conducted from the intentional radiator to the antenna shall not be greater than 8 dBm in any 3 kHz band during any time interval of continuous transmission.

In accordance with FCC Part 15.247(e) and RSS-247, the peak power spectral density should not exceed +8 dBm in any 3 kHz band. This measurement was performed along with the conducted power output readings performed as described in previous sections. The peak output frequency for each representative frequency was scanned, with a narrow bandwidth, and reduced sweep, and a power density measurement was performed.

Measurement procedure used was FCC OET KDB 558074 D01 Measurement Guidance v03r05 section 10.2 for WLAN and BLE.

The data reported includes all necessary correction factors. These correction factors are loaded onto the EMI receiver when measurements are performed.

Reported Measurement data = Raw receiver measurement (dBm) + Cable factor (dB) + Miscellaneous factors when applicable (dB).

Generic example of reported data at 2440 MHz:

Reported Measurement data = 8.55 (raw receiver measurement in dBm) + 0.85 (cable factor in dB) = 9.4 (dBm).

EXHIBIT 12. FREQUENCY STABILITY OVER VOLTAGE VARIATIONS

Test Engineer(s): Coty Hammerer

The frequency stability of the device was examined as a function of the input voltage available to the EUT. A Spectrum Analyzer was used to measure the RF output power and frequency at the appropriate frequency markers. Power was supplied by an external bench-type DC power supply and was varied from the minimum to maximum operating voltage because a variance of $\geq 10\%$ from the nominal voltage is outside the range of operation.

The power was then cycled On/Off to observe system response. No unusual response was observed, the emission characteristics were well behaved, and the system returned to the same state of operation as before the power cycle.

EXHIBIT 13. COMPLIANCE TO KDB 594280 D01

Manufacturer declaration:

Channels 12 and 13 are not activated for this module. The module will be programmed at the factory to only operate and actively scan on these specific channels:

Channels 1 – 11, 2412-2462 MHz 802.11b mode

Channels 1 – 11, 2412-2462 MHz 802.11g mode

Channels 1 – 11, 2412-2462 MHz 802.11n mode (20 MHz channel)

The module does not support any non-US channels or country code selection in all of the operational modes, like Ad-Hoc.
