Calibration procedure	DA CAL-06-v09 Calibration procedure for the data acquisition electronics (DAE)																																																																																																																																																																																																																
Calibration date	August 25, 2016																																																																																																																																																																																																																
This calibration certificate documents the traceability to national standards, which define the physical units of measurement (U). The measurement and its uncertainty with confidence probability are given on the following pages and are part of the certificate.																																																																																																																																																																																																																	
All calibrations have been conducted in the laboratory facility, environment temperature (20 ± 0.5°C) and humidity < 10%.																																																																																																																																																																																																																	
Calibration equipment used (DAE4) colour calibration.

Accredited by: Swiss Accreditation (SAA) The Swiss Accreditation (SAA) is one of the signatories to the EA Mutual Recognition Agreement for the recognition of calibration certificates.		Accreditation No.: SCA 0108	
User: DAE4 (TMR)		Certificate No.: DAE4-546_Aug16	
CALIBRATION CERTIFICATE			
Object:	TIMEPIECE - DD 0000 Dual BM - SN: 720		
Calibration procedure:	GA CAL-06 v0P Calibration procedure for the data acquisition electronics (DAS)		
Calibration date:	October 21, 2016		
This calibration certificate documents the traceability to calibrated reference, which realize the physical units of measurement (UoM). The measurements and the uncertainties with confidence intervals are given on the stated output and not on the intermediate. All calibrations have been conducted in the closed laboratory facility, environmental temperature (23 ± 0.5) °C and humidity < 70%.			
Calibration equipment used (NIST) referred to validation: Primary Standard: SI K Reference Certificate No.: 500.0000001 Reference Type: 2001 Secondary Standard: SI K Reference Certificate No.: 500.000.000.000.000.000 Reference Type: 2001 Axis 1: Calibration Lab Calibration Scale: 0.1 Axis 2: Calibration Lab Calibration Scale: 0.1

<p>Calibration Laboratory of Schmid & Partner Engineering AG Burgstrasse 41, 8401 Winterthur, Switzerland</p> <p>Accredited by the Swiss Accreditation Service (SAC)</p> <p>The Swiss Accreditation Service is one of the signatories to the ILAC Multilateral Agreement for the recognition of calibration certificates.</p> <p>Glossary</p> <p>DAE: data acquisition electronics</p> <p>Connector angle: Information used in DAEY system to align probe sensor X to the robot coordinate system.</p> <p>Methods Applied and Interpretation of Parameters</p> <ul style="list-style-type: none"> • DC Voltage Measurement: Calibration Factor assessed for use in DAEY system by comparison with a calibrated instrument traceable to national standards. The figure given corresponds to the full scale range of the voltmeter in the respective range. • Connector angle: The angle of the connector is assessed measuring the angle mechanically by a tool inserted. Uncertainty is not required. • The following parameters as documented in the Appendix contain technical information as a result from the performance test and require no uncertainty. • DC Voltage Measurement Linearity: Verification of the Linearity at +10% and -10% of the nominal calibration voltage. Influence of offset voltage is included in this measurement. • Common mode sensitivity: Influence of a positive or negative common mode voltage on the differential measurement. • Channel separation: Influence of a voltage on the neighbor channels not subject to an input voltage. • AD Converter Value with inputs shorted: Values on the internal AD converter corresponding to zero input voltage • Input Offset Measurement: Output voltage and statistical results over a large number of zero voltage measurements. • Input Offset Current: Typical value for information: Maximum channel input offset current, not considering the input resistance. • Input resistance: Typical value for information: DAE input resistance at the connector, during internal auto-zeroing and during measurement. • Low Battery Alarm Voltage: Typical value for information. Below this voltage, a battery alarm signal is generated. • Power consumption: Typical value for information. ^a Frequency-specific losses, dB (loss of 1.00 dB) were applied for 1000 Hz and higher (see Page 2), above it is reduced to ± 10 MHz. The uncertainty of the DASY uncertainty of specific frequency loss is the average for the two frequencies 1000 Hz and 10000 Hz. The probe diameter 300 MHz is ± 12.5%. All over 10 MHz the DASY uncertainty is ± 10% (assessed at 20, 40, 100, 1000 MHz and 10000 MHz respectively). Above 100 MHz frequency specific losses are not taken into account.

^b All frequencies below 10 GHz, the validity of tissue parameters is assumed to be valid up to 10% of liquid water content formula is applied to the DASY uncertainty for corrected signal measured in water. At the validity of tissue parameters is assumed to be valid up to 10% of liquid water content formula is applied to the DASY uncertainty for corrected signal measured in water. The uncertainty of the DASY of the DASY uncertainty for corrected signal measured in water is ± 10%.

^c All frequencies below 10 GHz, the validity of tissue parameters is assumed to be valid up to 10% of liquid water content formula is applied to the DASY uncertainty for corrected signal measured in water. The uncertainty of the DASY of the DASY uncertainty for corrected signal measured in water is ± 10%.

^d All frequencies below 10 GHz, the validity of tissue parameters is assumed to be valid up to 10% of liquid water content formula is applied to the DASY uncertainty for corrected signal measured in water. The uncertainty of the DASY of the DASY uncertainty for corrected signal measured in water is ± 10%.

^e All frequencies below 10 GHz, the validity of tissue parameters is assumed to be valid up to 10% of liquid water content formula is applied to the DASY uncertainty for corrected signal measured in water. The uncertainty of the DASY of the DASY uncertainty for corrected signal measured in water is ± 10%.

^f All frequencies below 10 GHz, the validity of tissue parameters is assumed to be valid up to 10% of liquid water content formula is applied to the DASY uncertainty for corrected signal measured in water. The uncertainty of the DASY of the DASY uncertainty for corrected signal measured in water is ± 10%.

N/A: Not applicable or not measured</p> <p>Calibration is Performed According to the Following Standards:</p> <ul style="list-style-type: none"> a) IEEE Std 1528-2012, "IEEE Recommended Practice for Determining the Peak Spatial-Averaged Specific Absorption Rate (SAR) in the Human Head from Wireless Communication Devices: Measurement Techniques", June 2013 b) IEC 62626-1, "Procedure to Measure the Specific Absorption Rate (SAR) for Hand-held devices used in close proximity to the ear (frequency range of 300 MHz to 3 GHz)", February 2005 c) IEC 62626-2, "Procedure to determine the Specific Absorption Rate (SAR) for wireless communication devices used in close proximity to the human body (frequency range of 10 MHz to 6 GHz)", March 2010 d) KDB 865964, "SAR Measurement Requirements for 100 MHz to 6 GHz" <p>Additional Documentation:</p> <ul style="list-style-type: none"> a) DAS2145 System Handbook <p>Methods Applied and Interpretation of Parameters:</p> <ul style="list-style-type: none"> ▪ Measurement Conditions: Further details are available from the validation Report at the end of the certificate. All figures stated in the certificate are valid at the frequency indicated. ▪ Antenna Parameters with TSL: The dipole is mounted with this spacer to position its feed point exactly below the center marking of the flat phantom section, with the arms oriented parallel to the body axis. ▪ Power, Power Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid-filled phantom. The impedance stated is transformed from the measured value at the SMA connector to the feed point. The Return Loss ensures low reflection losses. No uncertainty required. ▪ Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required. ▪ SAR measured: SAR measured at the stated antenna input power. ▪ SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector. ▪ SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result. <p>The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.</p> <p>Certificate No.: D750V3-1101_Oct18</p> <p>Page 2 of 6</p>

All figures stated in the certificate are valid at the frequency indicated. • Antenna Parameters with TSL: The dipole is mounted with the upper tip position in head point exactly below the ear marking of the flat phantom section, with the arms oriented parallel to the body axis. • Peak Power Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required. • Electrical Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required. • SAR measured: SAR measured at the stated antenna input power. • SAR-normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector. • SAR for normal TSL parameter: The measured TSL parameters are used to calculate the nominal SAR result. <p>The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor $k=2$, which for a normal distribution corresponds to a coverage probability of approximately 95%.</p> <div style="display: flex; justify-content: space-between; margin-top: 10px;"> Certificate No: D1900V2/SN:5d113_0010 Page 2 of 8 </div>

The antenna conductor of the feeding line is directly connected to the second arm of the dipole. The antenna is therefore unbalanced for DC signals. On some of the devices, small metal tabs are attached to the dipole wires in order to improve matching when tested according to the method as explained in the "Measurement Guidance" paragraph. This SAR data can not be linked to this change. The central dipole length is 60 mm. No excessive force must be applied to the dipole arms, because they might break or the soldered connections near the headpoint may be damaged.</p> <p>Additional EUT Data</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 15%;">Manufactured by</td> <td style="width: 85%;">SITAG</td> </tr> <tr> <td>Manufactured in</td> <td>July 24, 2009</td> </tr> </table> <div style="display: flex; justify-content: space-between; margin-top: 10px;"> Certificate No: D1900V2/SN:5d113_0010 Page 4 of 8 </div>	Impedance, Inextrapolated to Headpoint	11.1 Ω ± 0.0 Ω	Return Loss	-23.0 dB	Impedance, Inextrapolated to Headpoint	11.1 Ω ± 0.0 Ω	Return Loss	-21.0 dB	Electrical Delay (one wavelength)	1.000 ms	Manufactured by	SITAG	Manufactured in	July 24, 2009

All figures stated in the certificate are valid at the frequency indicated. ▪ Antenna Parameters: The dipole is mounted with the spacer to prevent its feed point exactly before the center matching of the first phantom antenna, with the arms oriented parallel to the body axis. ▪ Feed Point Impedance and Return Loss: These parameters are measured with the dipole positioned under the liquid filled phantom. The impedance stated is transformed from the measurement at the SMA connector to the feed point. The Return Loss ensures low reflected power. No uncertainty required. ▪ Antennas Delay: One-way delay between the SMA connector and the antenna feed point. No uncertainty required. ▪ SAR measured: SAR measured at the stated antenna input power. ▪ SAR normalized: SAR as measured, normalized to an input power of 1 W at the antenna connector. ▪ SAR for nominal TSL parameters: The measured TSL parameters are used to calculate the nominal SAR result. <p>The reported uncertainty of measurement is stated as the standard uncertainty of measurement multiplied by the coverage factor k=2, which for a normal distribution corresponds to a coverage probability of approximately 95%.</p> </div> <div style="width: 50%;"> <p>Certificate No.: SCS0108-V2018_00108</p> <p>Page 2 of 8</p> </div> </div> </div>	Phantom Model	D2450V2-SN738	Test Date (Certificate No.)	2018-10-23 (SCS 0108)	Submitted Certificate	2018-10-23 (SCS 0108)	Power-meter (MP)	HP 3446A	HP 3446A (Rev. 211000000000)	Apr-17			Power-meter (MP-2)	HP 3446A	HP 3446A (Rev. 211000000000)	Apr-17			Phantom (MP)	HP 3446A	HP 3446A (Rev. 211000000000)	Apr-17			Reference coil (MP)	HP 3446A	HP 3446A (Rev. 211000000000)	Apr-17			Type D measured parameters	HP 3446A (1-10 GHz)	HP 3446A (Rev. 211000000000)	Apr-17			Reference Power (DASYRS)	HP 77499	HP 77499 (300 MHz - 3 GHz VSWR 1.5)	Apr-17			DASYRS	HP 461	HP 461 (Rev. 1.0) DASYRS System Handbook	Apr-17			Secondary Reference:						Power-meter (PM) 0100	HP 3446A	HP 3446A (Rev. 211000000000)	Selected Choice			Power-meter (PM) 0101	HP 3446A	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0102	HP 3446A	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0103	HP 3446A	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0104	HP 3446A	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0105	HP 3446A	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0106	HP 3446A	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0107	HP 3446A	HP 3446A (Rev. 211000000000)	Power-meter (PM) 0108	HP 3446A	HP 3446A (Rev. 211000000000)	Calibrator:						Name:	Stefan Müller	Position:	Labassanturk	Signature:		Approved by:	Stefan Müller	Technician:	Technician Signature			Institute: Institute of Radiobiology						This calibration certificate shall not be reproduced except in full without written approval of the manager.

Appendix (Additional assessments outside the scope of SCS 0108):

Antenna Parameters with Head TSL:

Impedance, Normalized to feed point	39.8 Ω ± 0.1 Ω
Return Loss	-17.31 dB

Antenna Parameters with Body TSL:

Impedance, Normalized to feed point	46.7 Ω ± 0.4 Ω
Return Loss	-20.49 dB

General Antenna Parameters and Design:

Electrical Delay (one direction)	1.187 ms
----------------------------------	----------

After long-term use with 1000W radiating source, one slight warming of the dipole near the feedpoint can be measured.
The dipole is made of standard coaxial cables. The center conductor of the feeding line is directly connected to the feed-point of the dipole. The antenna is therefore characterized by SC-impedance. On some of the dipoles, short segments are added to the dipole arms in order to improve matching when tested according to the position as specified in the "Measurement and Guidance" paragraph. The SAR data are not affected by this change. The overall dipole length is still. No excessive force must be applied to the dipole arms, because they might bend or the soldered connections near the feedpoint may be damaged.

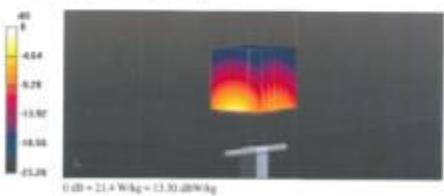

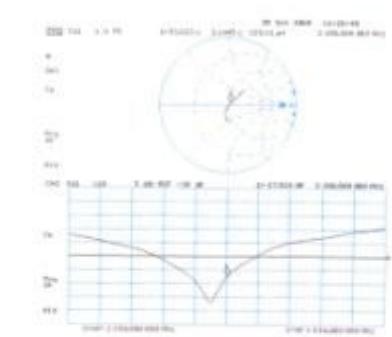

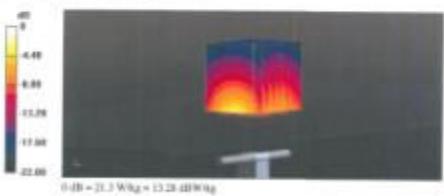

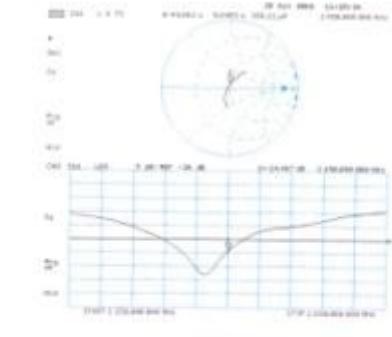

Additional EUT Data:

Manufactured by	SPICAS
Manufactured on	August 06, 2018

Certificate No.: SCS0108-V2018_00108

Reference Power (NIST)	SGR-100094	SGR-100094	SGR-100094																																																																								
Impedance, feed-point in free space	49.6 ± 0.0 Ω																																																																										
Return loss	-21.0 dB																																																																										
Impedance, feed-point in free space	45.6 ± 0.0 Ω																																																																										
Return loss	-20.7 dB																																																																										
Electrical Dipole (no direction)	1.149 m																																																																										
Manufactured by	OPENAIR																																																																										
Manufactured on	March 10, 2014																																																																										

D2600V2 Sn:1089	
<p>DASPS Validation Report for Head TSL.</p> <p>Date: 11/07/2018</p> <p>Test Configuration: D2600V2; Serial: D2600V2 - SN: 1089</p> <p>Communication System: TDSD - CW; Frequency: 2600 MHz</p> <p>Medium parameters used: $\epsilon_r = 27.0$; $\sigma = 27.0$; $\rho = 1000 \text{ kg/m}^3$</p> <p>Phantom source: Phantom</p> <p>Measurement Standard: DASPS (IEEE/ANSI/ASTM C19-2011)</p> <p>DASPS2 Configuration:</p> <ul style="list-style-type: none"> + Probe: B301W4; Calib: 17.95, 7.95, 7.96; Calibration: 11/06/2018 + Source Surface: Linear (Mechanical Surface Detection) + Electronics: DA41-S600; Calibrated: 30/12/2013 + Phantom: Flat Phantom 5.0 (back); Type: QD000PSAA; Serial: 1011 + DASPS2 SLD X (250); SLD CAD X (4.6, 14.6, 17.772) <p>Diode Calibration for Head Tissue/Phaz:250 mW, d=10mm/Zoom Scan (7x7x2)@Cube 0:</p> <p>Measured grid dimensions: 0.000 mm x 0.000 mm</p> <p>Reference Value = 117.2 W/kg; Power Dose = 0.00 J/cm²</p> <p>Peak SAR component = 11.2 W/kg</p> <p>SAR10 g = 14.4 W/kg; SAR10 g = 14.6 W/kg</p> <p>Maximum value of SAR (estimated) = 29.0 W/kg</p>  <p>Page 1 of 8</p>	<p>Impedance Measurement Plot for Head TSL.</p>  <p>Page 2 of 8</p>
