FCC ID: TQ8-FOB-4F53U

According to KDB 447498 D01 General RF Exposure Guidance v06.

At 100 Mb to 6 Gb and for test separation distances \leq 50 mm, the SAR test exclusion threshold is determined according to the following.

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] $x [\sqrt{f(Ghz)}] \le 3.0$

1. SAR test exclusion threshold

1.1. Frequency: 433.92 № (min. separation distances = 0 mm)

Calculation value: 0.058 (nW) / 5 (nm) x $\sqrt{0.433}$ 92 = 0.008 So, Calculation value \leq 3.0

Remark:

- Max. Radiated field strength 82.84 (dBµN/m): Max. E.I.R.P. of EUT -12.39 dBm (0.058 mW)
- When the minimum test separation distance is $< 5\,$ mm, a distance of $5\,$ mm is applied to determine SAR test exclusion.

1.2. Frequency: 6.5 础 (UWB)

- Maximum Allowed E.I.R.P.: -41.3 dBm (0.000 074 mW)
- The Maximum allowed RF output power of UWB is less than 1 mW. Per November 2019 TCB Workshop Notes, RF Exposure test is not required based on 1 mW exclusion for frequency over 6 GHz.

1.3. Simultaneous transmission Configuration

- The EUT do not transmit simultaneously.

2. Conclusion: No SAR is required.
