1 <u>TEST STANDARDS</u>

The tests were performed according to following standards:

<u>FCC Rules Part 15.247</u>: Frequency Hopping, Direct Spread Spectrum and Hybrid Systems that are in operation within the bands of 902-928 MHz, 2400-2483.5 MHz, and 5725-5850 MHz. <u>ANSI C63.10-2013</u>: American National Standard for Testing Unlicensed Wireless Devices

2 SUMMARY

2.1 General Remarks

2.1 General Remarks		
Date of receipt of test sample		Nov. 13, 2024
Testing commenced on		Nov. 13, 2024
Testing concluded on	:	Nov. 22, 2024

2.2 Product Description

	Testing commenced on	: Nov. 13, 2024	
	Testing concluded on	i Nov. 22, 2024	
	2.2 Product Descrip	otion	
TATE	Product Name:	Digital radio	
CIR	Model/Type reference:	DS226	
<i>y</i>	Power supply:	DC 6.0V From battery and AC 7.5V From external circuit	
	Adapter information:	Model: OBL-0750200U Input: AC 120V 60Hz 5W Output: AC 7.5V 200mA	
	Hardware version:	V1.0	
G	Software version:	V1.0	
	Testing sample ID:	CTA241119009-1# (Engineer sample) CTA241119009-2# (Normal sample)	
	Bluetooth :		
	Supported Type:	Bluetooth BR/EDR	
	Modulation:	GFSK, π/4DQPSK	
	Operation frequency:	2402MHz~2480MHz	
	Channel number:	79	
	Channel separation:	1MHz	
-59	Antenna type:	PCB antenna	
CTATE	Antenna gain:	0.75 dBi	
	L		

2.3 Equipment Under Test

Power supply system utilised

2.3 Equipment Under Test Power supply system utilised	d		CTATESTING	3	NG
Power supply voltage	:	Ο	230V / 50 Hz	120V / 60Hz	
		Ο	12 V DC	24 V DC	
			Other (specified in blank below	v)	

DC 6.0V From battery and AC 7.5V From external circuit

2.4 Short description of the Equipment under Test (EUT)

This is a Digital radio. For more details, refer to the user's manual of the EUT.

2.5 EUT operation mode

The Applicant provides communication tools software(Engineer mode) to control the EUT for staying in continuous transmitting (Duty Cycle more than 98%) and receiving mode for testing .There are 79 channels provided to the EUT and Channel 00/39/78 were selected to test.

Operation Frequency:	CTAIL
Channel	Frequency (MHz)
00	2402
01	2403

AC 7.5V From Adapter

2.7 Related Submittal(s) / Grant (s)

CTATE This submittal(s) (test report) is intended for the device filing to comply with Section 15.247 of the FCC Part 15, Subpart C Rules.

2.8 Modifications

No modifications were implemented to meet testing criteria.

TEST ENVIRONMENT 3

Address of the test laboratory 3.1

Shenzhen CTA Testing Technology Co., Ltd.

Room 106, Building 1, Yibaolai Industrial Park, Qiaotou Community, Fuhai Street, Bao'an District, Shenzhen, China

3.2 Test Facility

The test facility is recognized, certified, or accredited by the following organizations:

FCC-Registration No.: 517856 Designation Number: CN1318

Shenzhen CTA Testing Technology Co., Ltd. has been listed on the US Federal Communications Commission list of test facilities recognized to perform electromagnetic emissions measurements.

Shenzhen CTA Testing Technology Co., Ltd. has been listed by American Association for Laboratory Accreditation to perform electromagnetic emission measurement

CAB identifier: CN0127 ISED#: 27890

Shenzhen CTA Testing Technology Co., Ltd. has been listed by Innovation, Science and Economic Development Canada to perform electromagnetic emission measurement.

The 3m-Semi anechoic test site fulfils CISPR 16-1-4 according to ANSI C63.10 and CISPR 16-1-4:2010.

3.3 Environmental conditions

GA CTATESTING During the measurement the environmental conditions were within the listed ranges:

Radiated Emission:

Temperature:	24 ° C
Humidity:	45 %
Atmospheric pressure:	950-1050mbar

AC Power Conducted Emission:

Temperature:	25 ° C]
TESI		
Humidity:	46 %	CTING
Atmospheric pressure:	950-1050mbar	TATES!
conducted testing:		
Temperature:	25 ° C	7

Conducted testina:

25 ° C
44 %
950-1050mbar
AIN
TESI

Remark:

1. The measurement uncertainty is not included in the test result.

2. We tested all test mode and recorded worst case in report

3.5 Statement of the measurement uncertainty

The data and results referenced in this document are true and accurate. The reader is cautioned that there may be errors within the calibration limits of the equipment and facilities. The measurement uncertainty was calculated for all measurements listed in this test report acc. to TR-100028-01" Electromagnetic compatibility and Radio spectrum Matters (ERM);Uncertainties in the measurement of mobile radio equipment characteristics; Part 1" and TR-100028-02 "Electromagnetic compatibility and Radio spectrum Matters (ERM);Uncertainties in the measurement characteristics; Part 2" and is documented in the Shenzhen CTA Testing Technology Co., Ltd. quality system acc. to DIN EN ISO/IEC 17025. Furthermore, component and process variability of devices similar to that tested may result in additional deviation. The manufacturer has the sole responsibility of continued compliance of the device. Hereafter the best measurement capability for Shenzhen CTA Testing Technology Co., Ltd. :

		<u>, , , , , , , , , , , , , , , , , , , </u>	
Test	Range	Measurement Uncertainty	Notes
Radiated Emission	9KHz~30MHz	3.02 dB	(1)
Radiated Emission	30~1000MHz	4.06 dB	(1)
Radiated Emission	1~18GHz	5.14 dB	(1)
Radiated Emission	18-40GHz	5.38 dB	(1)
Conducted Disturbance	0.15~30MHz	2.14 dB	(1)
Output Peak power	30MHz~18GHz	0.55 dB	(1)
Power spectral density	/	0.57 dB	(1)

Shenzhen CTA Testing Technology Co., Ltd.

4 TEST CONDITIONS AND RESULTS

AC Power Conducted Emission 4.1

TEST CONFIGURATION

TEST PROCEDURE

1 The equipment was set up as per the test configuration to simulate typical actual usage per the user's manual. The EUT is a tabletop system, a wooden table with a height of 0.8 meters is used and is placed on the ground plane as per ANSI C63.10-2013.

2 Support equipment, if needed, was placed as per ANSI C63.10-2013

3 All I/O cables were positioned to simulate typical actual usage as per ANSI C63.10-2013

4 The EUT received power from adapter, the adapter received AC120V/60Hz and AC 240V/60Hz power through a Line Impedance Stabilization Network (LISN) which supplied power source and was grounded to the ground plane.

5 All support equipments received AC power from a second LISN, if any.

6 The EUT test program was started. Emissions were measured on each current carrying line of the EUT using a spectrum Analyzer / Receiver connected to the LISN powering the EUT. The LISN has two monitoring points: Line 1 (Hot Side) and Line 2 (Neutral Side). Two scans were taken: one with Line 1 connected to Analyzer / Receiver and Line 2 connected to a 50 ohm load; the second scan had Line 1 connected to a 50 ohm load and Line 2 connected to the Analyzer / Receiver.

7 Analyzer / Receiver scanned from 150 KHz to 30MHz for emissions in each of the test modes.

8 During the above scans, the emissions were maximized by cable manipulation.

AC Power Conducted Emission Limit

For intentional device, according to § 15.207(a) AC Power Conducted Emission Limits is as following :

	Limit	(dBuV)			
Frequency range (MHz)	Quasi-peak	Average			
0.15-0.5	66 to 56*	56 to 46*			
0.5-5	56	46			
5-30	60	50			

* Decreases with the logarithm of the frequency

TEST RESULTS

Remark:

1. All modes of GFSK, II/4 DQPSK were test at Low, Middle, and High channel; only the worst result of GFSK Middle Channel was reported as below:

Page 12 of 46

2. Both 120 VAC, 50/60 Hz and 240 VAC, 50/60 Hz power supply have been tested, only the worst result of 120 VAC, 60 Hz was reported as below:

4.2 **Radiated Emission**

TEST CONFIGURATION

Frequency range 30MHz - 1000MHz

Frequency range above 1GHz-25GHz

6.

TEST PROCEDURE

- 1. The EUT was placed on a turn table which is 0.8m above ground plane when testing frequency range 9 KHz -1GHz; the EUT was placed on a turn table which is 1.5m above ground plane when testing frequency range 1GHz - 25GHz.
- 2. Maximum procedure was performed by raising the receiving antenna from 1m to 4m and rotating the turn table from 0° to 360° to acquire the highest emissions from EUT.
- 3. And also, each emission was to be maximized by changing the polarization of receiving antenna both horizontal and vertical.
- Repeat above procedures until all frequency measurements have been completed. 4.
- Radiated emission test frequency band from 9KHz to 25GHz. 5.

The distance between test antenna and EUT as following table states:							
Test Frequency range	Test Distance						
9KHz-30MHz	Active Loop Antenna	3					
30MHz-1GHz	Ultra-Broadband Antenna	3					
1GHz-18GHz	Double Ridged Horn Antenna	3					
18GHz-25GHz	Horn Anternna	1					

Setting test receiver/spectrum as following table states:

Setting test receiver/spectrum as following table states.							
Test Frequency range	Test Receiver/Spectrum Setting	Detector					
9KHz-150KHz	RBW=200Hz/VBW=3KHz,Sweep time=Auto	QP					
150KHz-30MHz	RBW=9KHz/VBW=100KHz,Sweep time=Auto	QP					
30MHz-1GHz	RBW=120KHz/VBW=1000KHz,Sweep time=Auto	QP					
	Peak Value: RBW=1MHz/VBW=3MHz,						
1GHz-40GHz	Sweep time=Auto	Peak					
IGHZ-40GHZ	Average Value: RBW=1MHz/VBW=10Hz,	Peak					
	Sweep time=Auto						

Field Strength Calculation

The field strength is calculated by adding the Antenna Factor and Cable Factor and subtracting the Amplifier Gain and Duty Cycle Correction Factor(if any) from the measured reading. The basic equation with a sample calculation is as follows:

FS = RA + AF + CL - AG

sample calculation is as follows.	STINE
FS = RA + AF + CL - AG	CTATES
Where FS = Field Strength	CL = Cable Attenuation Factor (Cable Loss)
RA = Reading Amplitude	AG = Amplifier Gain
AF = Antenna Factor	

Transd=AF +CL-AG

RADIATION LIMIT

For intentional device, according to § 15.209(a), the general requirement of field strength of radiated emission from intentional radiators at a distance of 3 meters shall not exceed the following table. According to § 15.247(d), in any 100kHz bandwidth outside the frequency band in which the EUT is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20dB below that in the100kHz bandwidth within the band that contains the highest level of desired power.

The pre-test have done for the EUT in three axes and found the worst emission at position shown in test setup photos.

Frequency (MHz)	Distance (Meters)	Radiated (dBµV/m)	Radiated (µV/m)	
0.009-0.49	3	20log(2400/F(KHz))+40log(300/3)	2400/F(KHz)	
0.49-1.705	3	20log(24000/F(KHz))+ 40log(30/3)	24000/F(KHz)	
1.705-30	3	20log(30)+ 40log(30/3)	30	
30-88	3	40.0	100	
88-216	3	43.5	150	
216-960	3	46.0	200	
Above 960	3	54.0	500	

TATE

TEST RESULTS

Remark:

- This test was performed with EUT in X, Y, Z position and the worse case was found when EUT in X 1. position.
- We measured Radiated Emission at GFSK, π/4 DQPSK mode from 9 KHz to 25GHz and recorded worst 2. case at GFSK DH5 mode.
- For below 1GHz testing recorded worst at GFSK DH5 middle channel. 3.
- Radiated emission test from 9 KHz to 10th harmonic of fundamental was verified, and no emission found 4. except system noise floor in 9 KHz to 30MHz and not recorded in this report.

Maximum Peak Output Power 4.3

Limit

The Maximum Peak Output Power Measurement is 125mW (20.97).

Test Procedure

Remove the antenna from the EUT and then connect a low loss RF cable from the antenna port to CTATE the powersensor.

Test Configuration CTATESTING

Test Results

Туре	Channel	Output power (dBm)	Limit (dBm)	Result

20dB Bandwidth 4.4

Limit

For frequency hopping systems operating in the 2400MHz-2483.5MHz no limit for 20dB bandwidth.

Test Procedure

The transmitter output was connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured by spectrum analyzer with 30 KHz RBW and 100 KHz VBW.

The 20dB bandwidth is defined as the total spectrum the power of which is higher than peak power minus 20dB.

4.5 Frequency Separation

LIMIT

According to 15.247(a)(1), frequency hopping systems shall have hopping channel carrier frequencies separated by minimum of 25KHz or the 2/3*20dB bandwidth of the hopping channel, whichever is greater.

TEST PROCEDURE

The transmitter output was connected to the spectrum analyzer through an attenuator. The bandwidth of the fundamental frequency was measured by spectrum analyzer with100 KHz RBW and 300 KHz VBW.

Number of hopping frequency 4.6

Limit C

Frequency hopping systems in the 2400–2483.5 MHz band shall use at least 15 channels.

Test Procedure

GTA CTATE The transmitter output was connected to the spectrum analyzer through an attenuator. Set spectrum analyzer start 2400MHz to 2483.5MHz with 100 KHz RBW and 300 KHz VBW.

Test Configuration CTATES

Test Results

Test Results	CTAT	STING	
Modulation	Number of Hopping Channel	Limit	Result
GFSK	79	≥15	Pass
π/4DQPSK	79	215	Fass

4.7 Time of Occupancy (Dwell Time)

Limit

The average time of occupancy on any channel shall not be greater than 0.4 seconds within a period of 0.4 seconds multiplied by the number of hopping channels employed.

Test Procedure

The transmitter output was connected to the spectrum analyzer through an attenuator. Set center frequency of spectrum analyzer=operating frequency with 1MHz RBW and 1MHz VBW, Span 0Hz.

Test Configuration

Test Results

		6	1		-NTES
Modulation	Packet	Burst time (ms)	Dwell time (s)	Limit (s)	Result
	DH1	0.390	0.125	Contract of the second s	
GFSK	GDH3	1.650	0.264	0.40	Pass
TES	DH5	2.890	0.308		
Cir	2-DH1	0.390	0.125		
π/4DQPSK	2-DH3	1.640	0.262	0.40	Pass
	2-DH5	2.880	0.307	TESTIN	

Note:We have tested all mode at high, middle and low channel, and recoreded worst case at middle channel.

Dwell time=Pulse time (ms) × $(1600 \div 2 \div 79)$ ×31.6 Second for DH1, 2-DH1 Dwell time=Pulse time (ms) × $(1600 \div 4 \div 79)$ ×31.6 Second for DH3, 2-DH3 Dwell time=Pulse time (ms) × $(1600 \div 6 \div 79)$ ×31.6 Second for DH5, 2-DH5

CTA TESTING

Page 29 of 46

Out-of-band Emissions 4.8

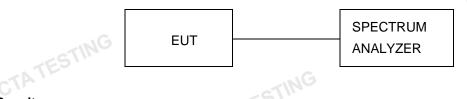

Limit

In any 100 kHz bandwidth outside the frequency band in which the spread spectrum or digitally modulated intentional radiator is operating, the radio frequency power that is produced by the intentional radiator shall be at least 20 dB below that in the 100 kHz bandwidth within the band that contains the highest level of the desired power, based on either an RF conducted or a radiated measurement, pro-vided the transmitter demonstrates compliance with the peak conducted power limits. If the transmitter com-plies with the conducted power limits based on the use of RMS averaging over a time interval, as permitted under paragraph (b)(3) of this section, the attenuation required under this paragraph shall be 30 dB instead of 20 dB. Attenuation below the general limits specified in §15.209(a) is not required.

Test Procedure

Connect the transmitter output to spectrum analyzer using a low loss RF cable, and set the spectrum analyzer to RBW=100 kHz, VBW= 300 kHz, peak detector, and max hold. Measurements utilizing these setting are CTATES made of the in-band reference level, bandedge and out-of-band emissions.

Test Configuration

Test Results

Remark: The measurement frequency range is from 30MHz to the 10th harmonic of the fundamental frequency. The lowest, middle and highest channels are tested to verify the spurious emissions and bandage measurement data.

We measured all conditions (DH1, DH3, DH5) and recorded worst case at DH5
