## 1.0 SCOPE

This report outlines the measurements made and results collected during the Electromagnetic emissions testing of the Itronix Corporation IX260+ Rugged Laptop PC including the internal Intel Pro 2200BG 802.11b/g 2.4 GHz DSSS WLAN Mini-PCI Card with the Rangestar internal dual surface-mount antenna, co-located with the Sierra Wireless AirCard 555 Dual-Band CDMA PCMCIA Modem with external swivel dipole antenna & mobile vehicle-mount antenna and cradle. The results were applied against the EMC requirements and limits outlined in the technical rules and regulations set forth in the Federal Communication Commission Code of Federal Regulations Title 47 Part 15 subpart J.

### 5.2 DUT Description

The DUT consisted of Model IX260+ Rugged Laptop PC with Intel Pro 2200BG 802.11b/g 2.4 GHz DSSS WLAN Mini-PCI Card installed in the Mini-PCI slot and Internal Dual Surface-Mount Antenna installed in the LCD display. Co-located within the Laptop PC is a Sierra Wireless AirCard 555 Dual-Band CDMA PCMCIA Modem with external swivel dipole antenna mounted to the upper right side of the LCD display. Photographs of the DUT placement and construction are shown in Appendix A.

## 5.7 Mode(s) of Operation Tested

Customer supplied software was used to place the WLAN card in the appropriate mode, channel and power level for the specific measurement. **As described by the client, PC installed firmware would insure that the AirCard 555 Radio Modem transmit mode would be disabled whenever the WLAN was active, therefore the radio modem was placed in receive mode during the measurements described herein.**

### **5.7.1 DUT Exercising Software Description**

The DUT was configured and exercised using customer supplied test software that allowed an operator to set the parameters of the WLAN operation. The settings used are described in each appendix. Unless otherwise noted the power gain settings were set for 29 for 802.11b and 24.5 for 802.11g and the data rate set for 1 Mbps for 802.11b and 6 Mbps for 802.11g.

### **5.8 Configuration Description**

The DUT was configured, as described by the client as being representative of what would be delivered to a final customer. This configuration included the radio modem and external antenna as described in section 5.2 installed in a typical manner. More specific details may be included in each appendix.

#### **5.8.1 Configuration Justification**

The DUT was tested in a configuration described by the client as being worse case but typical of normal use.

Prescan measurements were made with the WLAN in each of the two available modes (b & g), lowest, medium and highest bit rates and each of the lowest, highest and mid-band frequencies. From this preliminary data, it was determined that Channel 11, Mode b Rate 1 Mbps resulted in the highest emissions. When a measurement of Mode g was required, its data rate was set for a worse case setting of 6 Mbps. Unless otherwise specified in the applicable appendices, these settings were used for the measurements described in this report.

## **6.0 PASS/FAIL CRITERIA**

Unless otherwise noted in the Appendices, the pass/fail criteria is the limit set forth in the reference standards. A DUT is considered to have passed the requirements, if the data collected during the described measurement procedure is less than or equal to the specified limits as defined. The pass/fail statements made in this report only apply to the unit tested.

#### B.9. PASS/FAIL

In reference to the results outlined in B.8 the DUT passes the requirements as stated in the reference standards as follows:  
FCC 15.247 (2): The 6 dB bandwidth as measured meets the minimum 500 kHz bandwidth requirement.

#### B.10. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

Formulae:

Total CF = Antenna Factor + Cable Factor + Other Factor (Amplifier Gain, filter loss, etc)

Field Strength = SA Reading + Total CF

Limit Distance Correction =  $40 \times \log(d_1/d_2)$  for F<30 MHz,  $20 \times \log(d_1/d_2)$  for F> 30 MHz:

where d1 is the measurement distance, d2 is the published limit distance

Limit = Specified Limit + Limit Distance Correction

Margin = Limit - Field Strength

\*No harmonic emission where measured above the field strengths noted

\*The frequency points reported describe the highest emission measured in each of the ranges tested and are used to describe the measured spectrum as a whole. Emissions that may be present in the restricted bands are evaluated against the appropriate limits in Appendix F. No out-of-band emissions were measured above the levels noted.

#### E.10. PASS/FAIL

In reference to the results outlined in E.9, the DUT passes the requirements as stated in the reference standards as follows:  
FCC 15.247 (c): All emissions within any 100 kHz bandwidth outside the operating frequency band are greater than 20 dB below the maximum 100 kHz bandwidth signal within the operating band.

#### E.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.

#### F.5. MEASUREMENT EQUIPMENT SETUP

<b>MEASUREMENT EQUIPMENT CONNECTIONS</b>	The measurement equipment was connected as shown in the F.6. A number of antennas were used to cover the applicable frequency range test. The ranges in which each antenna was used are as follows:			
	Frequency Range	Antenna		
	9 kHz – 150 kHz	LP-105 Loop		
	150 kHz – 30 MHz	LG-105 Loop		
	30 MHz – 1 GHz	CBL-6111A Bilog		
	1 GHz – 18 GHz	ETS 3115 Horn		
<b>MEASUREMENT EQUIPMENT SETTINGS</b>	18 GHz– 26GHz	ETS 3160-09 Horn		
	The spectrum analyzer was set to the following settings:			
	Frequency Range	RBW	VBW	Detector
	MHz	KHz	KHz	
	0.009 - 0.150	0.200	10	Peak*
	0.150 - 30	9	30	Peak*
	30 – 1000	100	300	Peak*
	> 1000	1000*	1000	Peak*
*As a worse case measurement, the average/quasi-peak limits were applied to measurements made with a peak detector.

#### F.8. DUT OPERATING DESCRIPTION

The worst-case data rate was determined from prescan investigations. Measurements were made at three channels throughout the band, Low Channel (2412 MHz), Mid Channel (2437 MHz), High Channel (2462 MHz) and for both Modes b and g for the band-edge measurements and for Mode b for the remaining measurements.

\*The frequency points reported describe the highest emission measured in each of the ranges tested and are used to describe the measured spectrum as a whole. It is shown that the highest emissions measured within the spectrum pass the appropriate restricted limits; therefore all emissions within the restricted bands would also meet the requirements. No out-of-band emissions were measured above the levels noted.

Formulae:

Total CF = Antenna Factor + Cable Factor + Other Factor (Amplifier Gain, filter loss, etc)

Field Strength = SA Reading + Total CF

Limit Distance Correction =  $40 \log(d1/d2)$  for F<30 MHz,  $20 \log(d1/d2)$  for F> 30 MHz:

where d1 is the measurement distance, d2 is the published limit distance

Limit = Specified Limit + Limit Distance Correction

Margin = Limit - Field Strength

\*The frequency points reported describe the highest emission measured in each of the ranges tested and are used to describe the measured spectrum as a whole. It is shown that the highest emissions measured within the spectrum pass the appropriate restricted limits; therefore all emissions within the restricted bands would also meet the requirements. No out-of-band emissions were measured above the levels noted.

Formulae:

Total CF = Antenna Factor + Cable Factor + Other Factor (Amplifier Gain, filter loss, etc)

Field Strength = SA Reading + Total CF

Limit Distance Correction =  $40 \cdot \log(d_1/d_2)$  for F<30 MHz,  $20 \cdot \log(d_1/d_2)$  for F> 30 MHz:

where d1 is the measurement distance, d2 is the published limit distance

Limit = Specified Limit + Limit Distance Correction

Margin = Limit - Field Strength

\*The frequency points reported describe the highest emission measured in each of the ranges tested and are used to describe the measured spectrum as a whole. It is shown that the highest emissions measured within the spectrum pass the appropriate restricted limits; therefore all emissions within the restricted bands would also meet the requirements. No out-of-band emissions were measured above the levels noted.

### H.5. MEASUREMENT EQUIPMENT SETUP

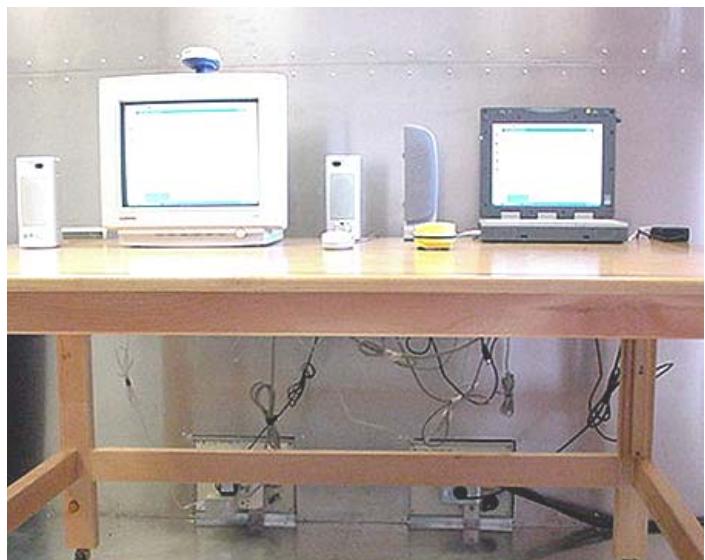

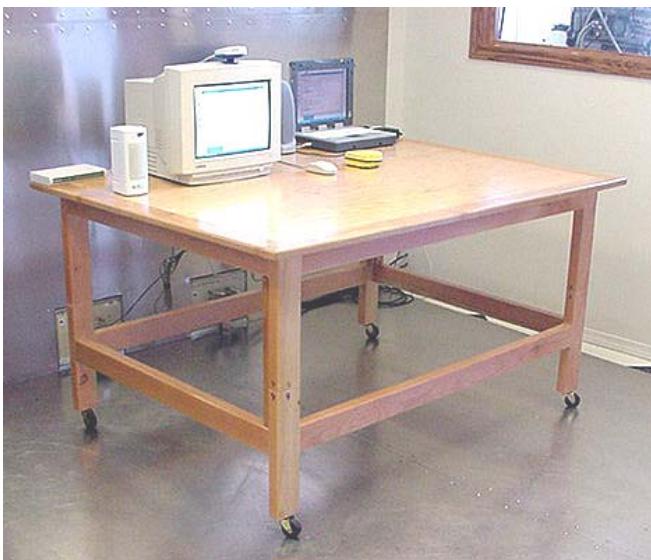

MEASUREMENT EQUIPMENT CONNECTIONS	The conducted emissions were measured on each of the two AC powerline leads connected to the DUT's power supply brick. A two line LISN was used to make this measurement. A drawing of the equipment setup is shown in H.6
MEASUREMENT EQUIPMENT SETTINGS	Each of the monitor ports from the 2-line LISN was connected in turn to the spectrum analyzer. The port not connected to the analyzer was terminated in a 50-ohm load. A prescan of the peak emission levels was made of the 150 kHz – 30 MHz range split into 4 equal frequency bands. The following were the spectrum analyzer settings: Start Frequency and Stop Frequency set by software for each of the four bands RBW: 100 kHz VBW: 300 kHz Sweep: 500 mS  The resulting data from each band was corrected and collected by software and presented in the graphical representations shown in H.8 for the two leads. The frequency points with the highest 10 levels on each lead were used by software to optimize a set of 20 readings for each type of detector (peak, quasi-peak and average). This data was corrected by the software is presented in the tables shown in section H.8.

## H.8. DUT OPERATING DESCRIPTION

<b>WLAN:</b>	The WLAN was set to transmit at full power on Channel 1, Mode g 6 Mb/s
<b>PC:</b>	Other than operating the WLAN software and running MS windows, no PC exercising was performed.
<b>Peripherals:</b>	All peripherals were active, but no specific traffic was initiated.

#### Calculations

CF = Correction Factor

Emission Level = Measured Level + correction factor

Margin = Limit – Emission Level

#### H.10. PASS/FAIL

In reference to the results outlined in H.8 the DUT passes the requirements as stated in the reference standards as follows:

- 1) The pass-band gain does not exceed the nominal gain of +10.0 dB stated by the manufacturer by more than 1.0 dB.
- 2) The gain outside the 20dB bandwidth does not exceed the gain at the 20 dB point (-10.0 dB).

#### H.11. SIGN-OFF

I attest to the accuracy of the data. All measurements reported herein were performed by me and are correct to the best of my knowledge and belief. I assume full responsibility for the completeness of these measurements.
