2.3. Conducted Limits (§15.207, §15.107 Class B)

Frequency	Maximum RF Line Voltage (dB μ V)	
	Quasi-Peak Level	Average Level
150kHz ~ 500kHz	66 ~ 56 dB μ V*	56 ~ 46 dB μ V*
500kHz ~ 5MHz	56 dB μ V	46 dB μ V
5MHz ~ 30MHz	60 dB μ V	50 dB μ V

- Remark:
1. * Decreases with the logarithm of the frequency.
 2. If the average limit is met when using a Quasi-Peak detector, the EUT shall be deemed to meet both limits and measurement with the average detector is unnecessary.

2.4. Operating Condition of EUT

- 2.4.1. Setup the EUT and simulator as shown on 2.2.
- 2.4.2. Turned on the power of all equipment.
- 2.4.3. Transmitting & Receiving Mode: The EUT transmitted data to the Universal Radio Communication Tester and received data from Radio Communication Tester through Bluetooth Band during all testing. (EUT's battery was charging status during the testing).
- 2.4.4. USB Link PC Mode: The EUT upload & download data to the Notebook PC via USB port during all testing.

2.5. Test Procedure

The EUT was put on table which was above the ground by 80cm and its AC/DC Adapter connected to the power mains through a line impedance stabilization network (L.I.S.N. #1) and the other peripheral devices power cord were connected to the power mains through a line impedance stabilization network (L.I.S.N. #2). This provided a 50 ohm coupling impedance for the measuring equipment. (Please refer to the block diagram of the test setup and photographs.)

Both sides of A.C. line were checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables were changed according to FCC ANSI C63.4-2001 on conducted measurement.

The bandwidth of R&S Test Receiver ESH3 was set at 10kHz.

The frequency range from 150kHz to 30MHz was checked.

EUT with following test modes and with 120V/60Hz (via AC/DC Adapter) supplying voltage were performed during conducted measurement, all the test results are attached in section 2.6.

Mode	Operation Mode	Type of Network	Frequency

3.4. Operating Condition of EUT

The configuration of EUT and its simulators were the same as those used in conducted measurement. Please refer to 2.4.

3.5. Test Procedure

The EUT and its simulators were placed on a turn table which was 0.8 meter above the ground. The turn table rotated 360 degrees to determine the position of the maximum emission level. EUT was set 3 meters away from the receiving antenna which was mounted on a antenna tower. The antenna moved up and down between 1 to 4 meters to find out the maximum emission level. Broadband antenna such as calibrated biconical and log- periodical antenna or horn antenna were used as a receiving antenna. Both horizontal and vertical polarization of the antenna were set on measurement. In order to find the maximum emission, all of the interface cables were manipulated according to FCC ANSI C63.4-2001 regulation.

The bandwidth of the R&S Test Receiver ESVP was set at 120kHz.
The bandwidth of the HP Spectrum Analyzer 8593EM was set at 1MHz.

The frequency range from 30MHz to 18GHz was checked.

The EUT with test voltage of AC 120V/60Hz and with following test mode were done during 30MHz~1000MHz frequency range and all the test results are listed in section 3.6.1. The above 1GHz frequency range test results are listed in section 3.6.2.

6.5. Test Results

PASSED. The testing data was attached in the next pages.

(Test Date: Apr. 16, 2004, Temperature: 24°C, Humidity: 62%)

Duty cycle: 79 channels*0.4 seconds = 31.6 seconds

DH1 : The system makes worst case 1600 hops per second or 1 time slot has a length of 625us with 79 channels. A DH1 packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 800 hops per second with 79 channels. So you have each channel 10.13 time per second and so for 31.6 seconds you have 320 time of appearance.

Each Tx-time per appearance is 408.3us.

$10.13 \text{ time} * 31.6 \text{ seconds} * 0.4083\text{ms} = 130.70\text{ms} (<400\text{ms})$

(Refer to Figure 6)

DH3 : The system makes worst case 1600 hops per second or 1 time slot has a length of 625us with 79 channels. A DH3 packet need 3 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 400 hops per second with 79 channels. So you have each channel 5.1 time per second and so for 31.6 seconds you have 161 time of appearance.

Each Tx-time per appearance is 1666.7us.

$5.1 \text{ time} * 31.6 \text{ seconds} * 1.6667\text{ms} = 268.60\text{ms} (<400\text{ms})$

(Refer to Figure 7)

DH5 : The system makes worst case 1600 hops per second or 1 time slot has a length of 625us with 79 channels. A DH5 packet need 1 time slot for transmitting and 1 time slot for receiving. Then the system makes worst case 266.7 hops per second with 79 channels. So you have each channel 3.37 time per second and so for 31.6 seconds you have 106 time of appearance.

Each Tx-time per appearance is 2916.7us.

$3.37 \text{ time} * 31.6 \text{ seconds} * 2.9\text{ms} = 308.83\text{ms} (<400\text{ms})$
