#### **GENERAL REMARKS**

The attached report shall not be reproduced except in full without the written permission of Timco Engineering Inc.

The test results relate only to the items tested.

Summary				
The device under test does:  ☐ Fulfill the general approval requirements as identified in this test report ☐ Not fulfill the general approval requirements as identified in this test report				
Attestations				
This equipment has been tested in accordance with the standards identified in this test report. To the best of my knowledge and belief, these tests were performed using the measurement procedures described in this report.				
All instrumentation and accessories used to test products for compliance to the indicated standards are calibrated regularly in accordance with ISO 17025: 2005 requirements.				
I attest that the necessary measurements were made at:				
Timco Engineering Inc. 849 NW State Road 45

#### **TEST PROCEDURES**

General: The test procedures used are detailed in ANSI/TIA 603-D.

Power Output: RF power was conducted per ANSI/TIA 603-D using a Spectrum analyzer and Attenuator

Bandwidth: The measurements were made with the spectrum analyzer's resolution bandwidth (RBW) = 1 MHz and the video bandwidth (VBW) = 3 MHz and the span set as shown on plot.

**Antenna Conducted Emissions:** The RBW = 100 kHz, VBW = 300 kHz and the span set to 10.0 MHz and the spectrum was scanned from 30 MHz to the 10<sup>th</sup> Harmonic of the fundamental. Above 1 GHz the resolution bandwidth was 1 MHz and the VBW = 3 MHz and the span to 50 MHz.

# **TEST PROCEDURES**

**Radiation Interference**: The test procedure used was ANSI/TIA 603-D using a Rohde & Schwartz Spectrum Analyzer with pre-selector. The bandwidth (RBW) of the spectrum receiver was 100 kHz up to 1 GHz and 1 MHz above 1 GHz with an appropriate sweep speed. The VBW above 1 GHz was 3 MHz. The analyzer was calibrated in dB above a microvolt at the output of the antenna.

#### **TEST PROCEDURES:**

**Frequency Stability:** The EUT was placed into a temperature chamber. After a reference frequency is measured at room temperature, The EUT frequency is measured at the required extreme temperatures after a 20 minute soak time at each said temperature. The EUT antenna output port was connected to a frequency counter for the frequency measurement of an unmodulated CW signal. The voltage was also varied + and - 15% with a variable DC power supply and the frequency measured and compared to the reference frequency.

#### **RF POWER OUTPUT**

Rule Part No.: FCC Part 2.1033(c)(6)(7), FCC Part 2.1046(a), FCC PART 95 Subpart A,

**Requirements:** There can be no provisions for increasing the power or varying the power. No GMRS channel, under any condition of modulation, shall exceed:

- 1. 50W Carrier power (average TP during one modulated RF cycle) when transmitting emissions type A1D, F1D, G1D, A3E, F3E, or G3E.
- 2. 50W peak envelope TP when transmitting emission type H1D, J1D, R1D, H3E, J3E, or R3E.

**Method of Measurement:** Conducted at the antenna port using a Spectrum Analyzer and Attenuator. With a nominal battery voltage and the transmitter properly adjusted the RF output measures:

# **MODULATION CHARACTERISTICS**

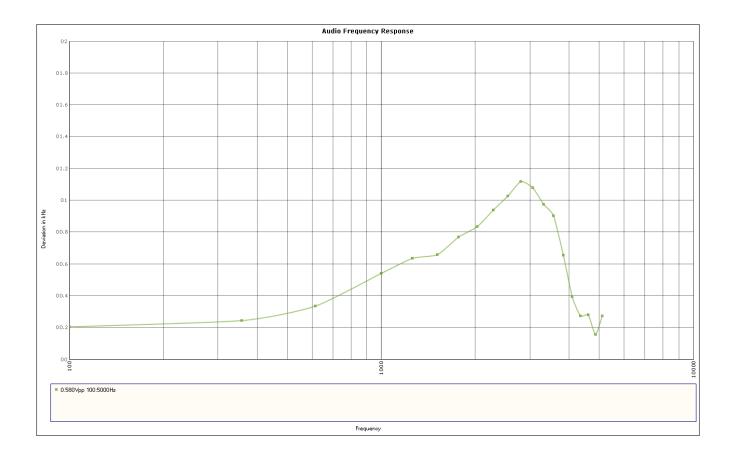

Part 2.1033(a) (b)

# **Requirements:**

# **Method of Measurement:**

The audio frequency response was measured in accordance with ANSI/TIA 603-D. The audio frequency response curve is shown below. The audio signal was fed into a dummy microphone circuit and into the microphone connector. The input required to produce 30 percent modulation level was measured.

# **Post Limiter Filter**

Each GMRS transmitter, except a mobile station transmitter with a power output of 2.5 W or less, must automatically prevent a greater than normal audio level from causing over modulation. The transmitter also must include audio frequency low pass filtering, unless it complies with the applicable paragraphs of §95.631 (without filtering.) The filter must be between the modulation limiter and the modulated stage of the transmitter. At any frequency (f in kHz) between 3 and 20 kHz, the filter must have an attenuation of at least 60 log10 (f/3) dB greater than the attenuation at 1 kHz. Above 20 kHz, it must have an attenuation of at least 50 dB greater than the attenuation at 1 kHz.

# **OCCUPIED BANDWIDTH**

Part 2.1049(c) EMISSION BANDWIDTH: 95.635(b) (1) (3) (7)

At least 25 dB on any frequency removed from the center of the authorized bandwidth by more than 50% up to and including 100% of the authorized bandwidth. At least 35 dB on any frequency removed from the center of the authorized BW by more than 100% up to and including 250% of the authorized BW. At least 43+log10 (TP) dB on any frequency removed from the center of the authorized bandwidth by more than 250%. See the following plot.

**Test procedure:** ANSI/TIA-603-D paragraph 2.2.11.

# **Method of Measuring Conducted Spurious Emissions**

**Requirements:** Greater than 250% removed = 43+10log (4.9) =49.9 dBc

**Method of Measurement:** The carrier was modulated 100% using a 2500 Hz tone. The spectrum was scanned from 0.4 to at least the 10th harmonic of the fundamental. The measurements were made in accordance with standard ANSI/TIA 603-D.

# FIELD STRENGTH OF SPURIOUS EMISSIONS

Rule Parts. No.: FCC Part 2.1053, 95.635(b) (7), IC RSS-210

**Requirements:** GMRS: 43 + 10log (4.9) = 49.9dB

**METHOD OF MEASUREMENT:** The tabulated data shows the results of the radiated field strength emissions test. The spectrum was scanned from 30 MHz to at least the tenth harmonic of the fundamental. This test was conducted per ANSI/TIA 603-D: 2010 using the substitution method. Only the worst case for each antenna polarity is shown.

# **FREQUENCY STABILITY**

**Rule Parts. No.:** FCC Part 2.1055 Part 95.621(b), IC RSS-210

**Requirements:** Temperature and voltage tests were performed to verify that the frequency remains within the 0.0005%, 5 ppm specification limit. The test was conducted as follows: The transmitter was placed in the temperature chamber at  $25^{\circ}$  C and allowed to stabilize for one hour. The transmitter was keyed ON for one minute during which four frequency readings were recorded at 15 second intervals. The worst case number was taken for temperature plotting. The assigned channel frequency was considered to be the reference frequency. The temperature was then reduced to  $-30^{\circ}$  C after which the transmitter was again allowed to stabilize for one hour. The transmitter was keyed ON for one minute, and again frequency readings were noted at 15 second intervals. The worst case number was recorded for temperature plotting. This procedure was repeated in 10 degree increments up to  $+50^{\circ}$  C.

Method of Measurements: ANSI/TIA 603-D
