Report by: Waldis V. Liepa, Ph.D. Report Date of Issue: August 6, 2014

Results of testing completed on (or before) July 17, 2014 are as follows.

Emissions: The transmitter intentional emissions COMPLY with the regulatory limit(s) by no less than 1.2 dB. Transmit chain spurious harmonic emissions COMPLY by no less than 0.6 dB. Unintentional spurious emissions from digital circuitry **COMPLY** with radiated emission limit(s) by more than 20 dB.

1 Test Specifications, General Procedures, and Location

1.1 Test Specification and General Procedures

The ultimate goal of Qolsys, Inc. is to demonstrate that the Equipment Under Test (EUT) complies with the Rules and/or Directives below. Detailed in this report are the results of testing the Qolsys, Inc. QS-5110-P01 for compliance to:

Country/Region	Rules or Directive	Referenced Section(s)
United States	Code of Federal Regulations	CFR Title 47, Part 15.231
Canada	Industry Canada	IC RSS-210/GENe

In association with the rules and directives outlined above, the following specifications and procedures are followed herein.

ANSI C63.4-2003	"Methods of Measurement of Radio-Noise Emissions from Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz"					
ICES-003; Issue 5 (2012)	"Information Technology Equipment (ITE) Limits and methods of measurement"					
Industry Canada	"The Measurement of Occupied Bandwidth"					

1.2 Test Location and Equipment Used

Test Location The EUT was fully tested by **The University of Michigan Radiation Laboratory**, 3228 EECS Building, Ann Arbor, Michigan 48109-2122 USA. The Test Facility description and attenuation characteristics are on file with the FCC Laboratory, Columbia, Maryland (FCC Reg. No: 91050) and with Industry Canada, Ottawa, ON (File Ref. No: IC 2057A-1).

Test Equipment Pertinent test equipment used for measurements at this facility is listed in Table 1. The quality system employed at The University of Michigan Radiation Laboratory has been established to ensure all equipment has a clearly identifiable classification, calibration expiry date, and that all calibrations are traceable to the SI through NIST, other recognized national laboratories, accepted fundamental or natural physical constants, ratio type of calibration, or by comparison to consensus standards.

Table 1: The University of Michigan Radiation Laboratory Equipment List.

Test Instrument	Manufacturer/Model	Q Number

2 Configuration and Identification of the Equipment Under Test

2.1 Description and Declarations

The EUT is a wireless smoke heat alarm. The EUT is approximately 16 x 16 x 4 cm in dimension, and is depicted in Figure 1. It is powered by a 4.5 VDC alkaline batteries. In use, this device is affixed in a residential setting. Table 2 outlines provider declared EUT specifications.

Figure 1: Photos of EUT.

Table 2: EUT Declarations.

General Declarations			
Equipment Type:	Wireless Smoke Heat Alarm	Country of Origin:	USA
Nominal Supply:	4.5 VDC	Oper. Temp Range:	Not Declared
Frequency Range:	$319.5~\mathrm{MHz}$	Antenna Dimension:	$8 \times 2 \times 0.3 \text{ cm}$
Antenna Type:	PCB trace	Antenna Gain:	Not Declared (integral)
Number of Channels:	1	Channel Spacing:	Not Applicable
Alignment Range:	$319.5~\mathrm{MHz}$	Type of Modulation:	PPM
United States			
FCC ID Number:	2AAJX-QS5110P01	Classification:	DSC
Canada			
IC Number:	11205A-QS5110P01	Classification:	Security Device / Alarm System, Remote Control Device

2.1.1 EUT Configuration

The EUT is configured for testing as depicted in Figure 2.

2.1.2 Modes of Operation

The EUT is capable of two key modes of operation. ALARM mode and HEARTBEAT mode. In ALARM mode, the EUT transmits one packet of 8 frames approximately every 8.7 seconds during an alarm state. In HEARTBEAT mode (non-emergency system integrity mode) the EUT transmits a single packet of 8 frames approximately once every 60 minutes to ensure safety system integrity.

2.1.3 Variants

There is only a single variant of the EUT, as tested.

EUT

Qolsys, Inc.
Wireless Smoke Heat Alarm
Model: QS-5110-PO1
FCC ID: 2AAJX-QS5110P01
IC: 11205A-QS5110P01

Figure 2: EUT Test Configuration Diagram.

2.1.4 Test Samples

Two samples in total were provided. One normal sample capable of alarm and heartbeat transmission modes, and one sample to take apart for photos.

2.1.5 Functional Exerciser

Normal operating EUT functionality was verified by observation of transmitted signal from EUT after shaking it.

2.1.6 Modifications Made

No modifications were made to the EUT.

2.1.7 Production Intent

The EUT appears to be a production ready sample.

2.1.8 Declared Exemptions and Additional Product Notes

The EUT employs some modes used to ensure the integrity of the alarm system. Such modes fall under FCC 15.231(a)(3). The EUT also employs some modes of operation that alert the user in the event of an emergency. Such alert modes fall under FCC 15.231(a)(4), and may operate during the pendency of the alarm condition.

3 Emissions

3.1 General Test Procedures

3.1.1 Radiated Test Setup and Procedures

Radiated electromagnetic emissions from the EUT are first evaluated in our shielded fully anechoic chamber. Spectrum and modulation characteristics of all emissions are recorded, and emissions above 1 GHz are fully characterized. The anechoic chamber contains a set-up similar to that of our outdoor 3-meter site, with a turntable and antenna mast. Instrumentation, including spectrum analyzers and other test equipment as detailed in Section 1.2 are employed. After indoor pre-scans, emission measurements are made on our outdoor 3-meter Open Area Test Site (OATS). If the EUT connects to auxiliary equipment and is table or floor standing, the configurations prescribed in ANSI C63.4 / CISPR-22 are followed. Alternatively, a layout closest to normal use (as declared by the provider) is employed if the resulting emissions appear to be worst-case in such a configuration. See Figure 3.

Figure 3: Radiated Emissions Diagram of the EUT.

intentionally radiating elements that are not fixed-mounted in use are placed on the test table lying flat, on their side, and on their end (3-axes) and the resulting worst case emissions are recorded. If the EUT is fixed-mounted in use, measurements are made with the device oriented in the manner consistent with installation and then emissions are recorded.

If the EUT exhibits spurious emissions due to internal receiver circuitry, such emissions are measured with an appropriate carrier signal applied. For devices with intentional emissions below 30 MHz, a shielded loop antenna is used as the test antenna. It is placed at a 1 meter receive height and appropriate low frequency magnetic field extrapolation to the regulatory limit distance is employed. Emissions between 30 MHz and 1 GHz are measured using tuned dipoles and/or calibrated broadband antennas. For both horizontal and vertical polarizations, the test antenna is raised and lowered from 1 to 4 m in height until a maximum emission level is detected. The EUT is then rotated through 360° in azimuth until the highest emission is detected. The test antenna is then raised and lowered one last time from 1 to 4 m and the worst case value is recorded. Emissions above 1 GHz are characterized using standard gain horn antennas or calibrated broadband ridge-horn antennas. Care is taken to ensure that test receiver resolution and video bandwidths meet the regulatory requirements, and that the emission bandwidth of the EUT is not reduced. Photographs of the test setup employed are depicted in Figure 4.

Where regulations allow for direct measurement of field strength, power values (dBm) measured on the test receiver / analyzer are converted to $dB\mu V/m$ at the regulatory distance, using

$$E_{dist} = 107 + P_R + K_A - K_G + K_E - C_F$$

where P_R is the power recorded on spectrum analyzer, in dBm, K_A is the test antenna factor in dB/m, K_G is the combined pre-amplifier gain and cable loss in dB, K_E is duty correction factor (when applicable) in dB, and C_F is

a distance conversion (employed only if limits are specified at alternate distance) in dB. This field strength value is then compared with the regulatory limit. If effective isotropic radiated power (EIRP) is compute, it is computed as

$$EIRP(dBm) = E_{3m}(dB\mu V/m) - 95.2.$$

When presenting data at each frequency, the highest measured emission under all possible EUT orientations (3-axes) is reported.

Figure 4: Radiated Emissions Test Setup Photograph(s).

3.1.2 Conducted Emissions Test Setup and Procedures

Battery Power Conducted Spurious The EUT is not subject to measurement of power line conducted emissions as it is powered solely by its internal battery.

3.1.3 Power Supply Variation

Tests at extreme supply voltages are made if required by the procedures specified in the test standard, and results of this testing are detailed in this report.

In the case the EUT is designed for operation from a battery power source, the extreme test voltages are evaluated over the range specified in the test standard; no less than $\pm 10\%$ of the nominal battery voltage declared by the manufacturer. For all battery operated equipment, worst case intentional and spurious emissions are re-checked employing a new (fully charged) battery.

3.2 Intentional Emissions

3.2.1 Fundamental Emission Pulsed Operation

The details and results of testing the EUT for pulsed operation are summarized in Table 3. Plots showing the measurements made to obtain these values are provided in Figure 5.

Table 3: Pulsed Emission Characteristics (Duty Cycle).

In ALARM mode, the EUT transmits one packet of 8 frames approximately every 8.7 seconds during the an the alarm condition. Each frame is more than 100 ms from the next, and consists of 18 ms of PPM modulated data made up of two 0.99 ms pulses and 58 (fifty-eight) 0.130 ms pulses. In HEARTBEAT mode (non-emergency system integrity mode) the EUT transmits a single identical frame of 8 packets once every 60 minutes to ensure safety system integrity.

	Duty Cycle Computation A	pollo Smoke; FCC/IC
1	$KE = (2 \times 0.99 \text{ ms} + 58 \times 0.130 \text{ ms}) / 100 \text{ ms} = 0.0952 < -20 \text{ dB}$	
2	HEARTBEAT On-Time / Hr = 8 packets x (2 x 0.99 ms + 58 x 0.130 ms) / Hr = 76.2 ms / Hr

Figure 5: Pulsed Emission Characteristics (Duty Cycle).

3.2.2 Fundamental Emission Bandwidth

Emission bandwidth (EBW) of the EUT is measured with the device placed in the test mode(s) with the shortest available frame length and minimum frame spacing. Radiated emissions are recorded following the test procedures listed in Section 1.1. The 20 dB EBW is measured as the max-held peak-detected signal when the IF bandwidth is greater than or equal to 1% of the receiver span. For complex modulations other than ASK and FSK, the 99% emission bandwidth per IC test procedures has a different result, and is also separately reported. The results of EBW testing are summarized in Table 4. Plots showing measurements employed to obtain the emission bandwidth reported are provided in Figure 6.

Table 4: Intentional Emission Bandwidth.

The emission bandwidth of the signal is shown in the following Figure. The allowed 99% bandwidth is 0.25% of 319.5 MHz, or 798.75 kHz.

3.2.3 Fundamental Emission

Following the test procedures listed in Section 1.1, radiated emissions measurements are made on the EUT for both Horizontal and Vertical polarized fields. Table 5 details the results of these measurements.

Table 5: Fundamental Radiated Emissions.

Frequency Range	Det	IF Bandwidth	Video Bandwidth

3.3 Unintentional Emissions

3.3.1 Transmit Chain Spurious Emissions

The results for the measurement of transmit chain spurious emissions at the nominal voltage and temperature are provided in Table 6. Measurements are performed to 10 times the highest fundamental operating frequency.

Table 6: Transmit Chain Spurious Emissions.

Frequency Range	Det	IF Bandwidth	Video Bandwidth
25 MHz f 1 000 MHz	Pk/QPk	120 kHz	300 kHz

3.3.2 Radiated Digital Spurious

The results for the measurement of digital spurious emissions are not reported herein as all digital emissions were greater than 20 dB below the regulatory limit. Radiation from digital components was measured to 4 GHz, or to five times the maximum digital component operating frequency, whichever is greater.
