## RF Exposure evaluation FCC ID:2BG80-HHX001

According to 447498 D01 General RF Exposure Guidance v06 The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq$  50 mm are determined by: [(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)] • [ \( \sqrt{f(GHz)} \)] \( \leq 3.0 \) for 1-g SAR and  $\leq 7.5$  for 10-g extremity SAR, where

 $\ensuremath{\text{f(GHz)}}$  is the RF channel transmit frequency in GHz Power and distance are rounded to the nearest mW and mm before calculation

The result is rounded to one decimal place for comparison

## 433.92MHz

Field strength =76.62 dBuV/m @3m Ant gain =-21.73 dBi ;so Ant numeric gain= 0.01

So EIRP=76.62-95.2=-18.58dBm

Power	Power	Distance	Freq	SAR Test	SAR Limit
(dBm)	( mW )	( mm )	(GHz)	Exclusio	
-18.58	0.013867	5	0.43392	0.001827	<pre>≤ 3.0 for 1-g SAR</pre>

Then SAR evaluation is not required
