## Necessary Bandwidth and Emission Designators

SPECIFICATION: FCC 47 CFR 2.202

The Necessary Bandwidth is the minimum value of the occupied bandwidth sufficient to ensure the transmission of information at the rate and with the quality required for the system employed.

This is calculated using the following formula.

$B_n = 2M + 2DK$       Where:  $B_n$  = Necessary Bandwidth  
                                          $M$  = Maximum modulation frequency  
                                              For Data transmission  
                                          $M = B/2$   
                                              Where:  $B$  = Modulation rate in Baud  
                                          $D$  = Peak deviation  
                                          $K$  = Constant  
                                              For Analogue transmission this is 1  
                                              For Data transmission this is typically 1.2

### 1. Analogue Voice 12.5kHz Bandwidth

## APPENDIX A

### TEST SETUP DETAILS

Test set up for Radiated Emissions

All other testing is performed using the Teltest Radio **EVAL**uation system (TREVA), which is configured as shown below. The Spectrum Analyser is connected to the EUT via the attenuator network for Conducted Emissions testing, and Occupied Bandwidth.
