

Report No.: T150715D03-RP1-1

According to KDB 447498 section 4.3.1, the 1-g SAR test exclusion thresholds at test separation distance ≤ 50 mm are determined by:

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] \*·[ $\sqrt{f(GHz)}$ ]  $\leq 3.0$ 

The tune-up power is 2 dBm +/- 2dB, therefore the highest tune-up power is 2.3 dBm (1.69 mW) @ 2402 MHz

When the minimum test separation distance is < 5 mm, a distance of 5 mm according to 5) in section 4.1 is applied to determine SAR test exclusion.

So.  $(2mW / 5mm) * (2.402GHz ^0.5) = 0.5$ 

[(max. power of channel, including tune-up tolerance, mW) / (min. test separation distance, mm)] \*  $[\sqrt{f(GHz)}] = 0.5 < 3.0$ 

Therefore, standalone SAR measurements are not required for both head and body.
