The above equipment has been tested by World Standardization Certification & Testing Group(Shenzhen)Co., Ltd. and found compliance with the requirements set forth in the technical standards mentioned above. The results of testing in this report apply only to the product/system, which was tested. Other similar equipment will not necessarily produce the same results due to production tolerance and measurement uncertainties.

## 4. Genera Information

4.1. Test environment and mode

#### Operating Environment:

| Temperature:          | 25.0 °C   |
|-----------------------|-----------|
| Humidity:             | 56 % RH   |
| Atmospheric Pressure: | 1010 mbar |

#### Test Mode:

Engineering mode:

Keep the EUT in continuous transmitting by select channel and modulations with Fully-charged battery

ilac-MRA

The sample was placed 0.8m & 1.5m for the measurement below & above 1GHz above the ground plane of 3m chamber. Measurements in both horizontal and vertical polarities were performed. During the test, each emission was maximized by: having the EUT continuously working, investigated all operating modes, rotated about all 3 axis (X, Y & Z) and considered typical configuration to obtain worst position, manipulating interconnecting cables, rotating the turntable, varying antenna height from 1m to 4m in both horizontal and vertical polarizations. The emissions worst-case are shown in Test Results of the following pages.

## 4.2. Description of Support Units

The EUT has been tested as an independent unit together with other necessary accessories or support units. The following support units or accessories were used to form a representative test configuration during the tests.

| Equipment | Model No. | Serial No. | FCC ID | Trade Name |
|-----------|-----------|------------|--------|------------|
|           |           |            | /      | / /        |

Note:

M \* P

- 1. All the equipment/cables were placed in the worst-case configuration to maximize the emission during the test.
- 2. Grounding was established in accordance with the manufacturer's requirements and conditions for the intended
  - use.

S

3. For conducted measurements (Output Power, 20dB Occupied Bandwidth, Carrier Frequencies Separation, Hopping Channel Number, Dwell Time, Spurious Emissions), the antenna of EUT is connected to the test equipment via temporary antenna connector, the antenna connector is soldered on the antenna port of EUT, and the temporary antenna connector is listed in the Test Instruments.

## 6. Test Results and Measurement Data

#### 6.1. Antenna requirement

#### Standard requirement: FCC

FCC Part15 C Section 15.203 /247(c)

#### 15.203 requirement:

An intentional radiator shall be designed to ensure that no antenna other than that furnished by the responsible party shall be used with the device. The use of a permanently attached antenna or of an antenna that uses a unique coupling to the intentional radiator, the manufacturer may design the unit so that a broken antenna can be replaced by the user, but the use of a standard antenna jack or electrical connector is prohibited.

15.247(c) (1)(i) requirement:

(i) Systems operating in the 2400-2483.5 MHz band that is used exclusively for fixed. Point-to-point operations may employ transmitting antennas with directional gain greater than 6dBi provided the maximum conducted output power of the intentional radiator is reduced by 1 dB for every 3 dB that the directional gain of the antenna exceeds 6dBi.

#### E.U.T Antenna:

S

M \* P

The Bluetooth antenna is a FPC Antenna. it meets the standards, and the best case gain of the antenna is 1.03 dBi.

MOM \* P

## 6.2. Conducted Emission

6.2.1. Test Specification FCC Part15 C Section 15.207 **Test Requirement:** Test Method: ANSI C63.10:2014 Frequency Range: 150 kHz to 30 MHz RBW=9 kHz, VBW=30 kHz, Sweep time=auto **Receiver** setup: Frequency range Limit (dBuV) Quasi-peak (MHz) Average Limits: 0.15-0.5 66 to 56\* 56 to 46\* 0.5-5 46 56 5 - 3050 60 Reference Plane LISN 40cm 80cm Filter - AC power E.U.T AC power EMI Test Setup: Receiver Test table/Insulation plane Remark E.U.T: Equipment Under Test LISN: Line Impedence Stabilization Network Test table height=0.8m Test Mode: Refer to item 4.1 1. The E.U.T is connected to an adapter through a line impedance stabilization network (L.I.S.N.). This provides a 50ohm/50uH coupling impedance for the measuring equipment. 2. The peripheral devices are also connected to the main power through a LISN that provides a 50ohm/50uH coupling impedance with 50ohm termination. (Please **Test Procedure:** refer to the block diagram of the test setup and photographs). 3. Both sides of A.C. line are checked for maximum conducted interference. In order to find the maximum emission, the relative positions of equipment and all of the interface cables must be changed according to ANSI C63.10:2014 on conducted measurement. on & Tea PASS Test Result: W5C7 ADD:Building A-B Baoshi Science & Technology Park, Baoshi Road, Bao'an District, Shenzhen, Guangdong, China TEL:86-755-26996192 26992306 FAX 86-755-86376605 E-mail: Fengbing, Wang@wsci-cert.com Http://www.wsci-cert.com 世纪检测认证授价

## 6.5. Carrier Frequencies Separation

6.5.1. Test Specification

| Test Requirement: | FCC Part15 C Section 15.247 (a)(1)  |  |
|-------------------|---|--|
| Test Method:      | ANSI C63.10:2014  |  |
| Limit:            | Frequency hopping systems operating in the<br>2400-2483.5 MHz band may have hopping channel<br>carrier frequencies that are separated by 25 kHz or<br>two-thirds of the 20 dB bandwidth of the hopping<br>channel, whichever is greater.  |  |
| Test Setup:       | Spectrum Analyzer EUT   |  |
| Test Mode:        | Hopping mode  |  |
| Test Procedure:   | <ol> <li>The testing follows ANSI C63.10:2014 Measurement<br/>Guidelines.</li> <li>The RF output of EUT was connected to the spectrum<br/>analyzer by RF cable and attenuator. The path loss was<br/>compensated to the results for each measurement.</li> <li>Set to the maximum power setting and enable the EUT<br/>transmit continuously.</li> <li>Enable the EUT hopping function.</li> <li>Use the following spectrum analyzer settings:<br/>Span = wide enough to capture the peaks of two adjacent<br/>channels; RBW is set to approximately 30% of the channel<br/>spacing, adjust as necessary to best identify the center of<br/>each individual channel; VBW≥RBW; Sweep = auto;<br/>Detector function = peak; Trace = max hold.</li> <li>Use the marker-delta function to determine the separation<br/>between the peaks of the adjacent channels. Record the<br/>value in report.</li> </ol> |  |
| Test Result:      | PASS  |  |

| 1-DH3 | 2480               | 1.653              | 267.786                  | 162            | 31600               | 400           | Pass    |
| 1-DH5 | 2402               | 2.902              | 310.514                  | 107            | 31600               | 400           | Pass    |
| 1-DH5 | 2441               | 2.9                | 290                      | 100            | 31600               | 400           | Pass    |
| 1-DH5 | 2480               | 2.901              | 290.1                    | 100            | 31600               | 400           | Pass    |

Note: 1. In normal mode, hopping rate is 1600 hops/s with 6 slots in 79 hopping channels.

For DH1, With channel hopping rate (1600 / 2 / 79) in Occupancy Time Limit  $(0.4 \times 79)$  (s), Hops Over Occupancy Time comes to  $(1600 / 2 / 79) \times (0.4 \times 79) = 320$  hops

For DH3, With channel hopping rate (1600 / 4 / 79) in Occupancy Time Limit  $(0.4 \times 79)$  (s), Hops Over Occupancy Time comes to  $(1600 / 4 / 79) \times (0.4 \times 79) = 160$  hops

For DH5, With channel hopping rate (1600 / 6 / 79) in Occupancy Time Limit (0.4 x 79) (s), Hops Over Occupancy Time comes to (1600 / 6 / 79) x (0.4 x 79) = 106.67 hops

2. Dwell Time(s) = Hops Over Occupancy Time (hops) x Package Transfer Time

## 6.8. **Pseudorandom Frequency Hopping Sequence**

Test Requirement:

on & Te

M \* P

S

### FCC Part15 C Section 15.247 (a)(1) requirement:

Frequency hopping systems shall have hopping channel carrier frequencies separated by a minimum of 25 kHz or the 20 dB bandwidth of the hopping channel, whichever is greater.

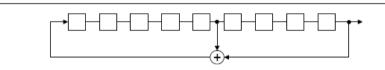

Alternatively. Frequency hopping systems operating in the 2400-2483.5 MHz band may have hopping channel carrier frequencies that are separated by 25 kHz or two-thirds of the 20 dB bandwidth of the hopping channel, whichever is greater, provided the systems operate with an output power no greater than 125 mW. The system shall hop to channel frequencies that are selected at the system hopping rate from a Pseudorandom ordered list of hopping frequencies. Each frequency must be used equally on the average by each transmitter. The system receivers shall have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shall shift frequencies in synchronization with the transmitted signals.

### EUT Pseudorandom Frequency Hopping Sequence

The pseudorandom sequence may be generated in a nine-stage shift register whose 5th and 9th stage outputs are added in a modulo-two addition stage. And the result is fed back to the input of the first stage. The sequence begins with the first one of 9 consecutive ones; i.e. the shift register is initialized with nine ones. • Number of shift register stages: 9

• Length of pseudo-random sequence:  $2^9 - 1 = 511$  bits

Longest sequence of zeros: 8 (non-inverted signal)

Linear Feedback Shift Register for Generation of the PRBS sequence

An example of Pseudorandom Frequency Hopping Sequence as follow:

|   | 0 | 2 | 4 | 6 | 6 | 2 | 64 | 78 | 1 |   | 73 | 75 | 77 |  |
|---|---|---|---|---|---|---|----|----|---|---|----|----|----|--|
|   |   |   |   |   | [ |   |    |    |   | { |    |    |    |  |
|   |   |   |   |   |   |   |    |    |   |   |    |    |    |  |
| / |   |   |   |   |   |   |    |    |   | } |    |    |    |  |

Each frequency used equally on the average by each transmitter. The system receivers have input bandwidths that match the hopping channel bandwidths of their corresponding transmitters and shift frequencies in synchronization with the transmitted signals.

## 6.9. Conducted Band Edge Measurement

6.9.1. Test Specification

| Test Requirement: | FCC Part15 C Section 15.247 (d)  |
|-------------------|--|
| Test Method:      | ANSI C63.10:2014   |
| Limit:            | In any 100 kHz bandwidth outside the intentional<br>radiation frequency band, the radio frequency power<br>shall be at least 20 dB below the highest level of the<br>radiated power. In addition, radiated emissions which fall<br>in the restricted bands must also comply with the<br>radiated emission limits.  |
| Test Setup:       | Spectrum Analyzer  |
| Test Mode:        | Transmitting mode with modulation  |
| Test Procedure:   | <ol> <li>The testing follows the guidelines in Band-edge<br/>Compliance of RF Conducted Emissions of ANSI<br/>C63.10:2014 Measurement Guidelines.</li> <li>Set to the maximum power setting and enable the<br/>EUT transmit continuously.</li> <li>Set RBW = 100 kHz (≥1% span=10MHz), VBW = 300<br/>kHz (≥RBW). Band edge emissions must be at least<br/>20 dB down from the highest emission level within<br/>the authorized band as measured with a 100kHz<br/>RBW. The attenuation shall be 30 dB instead of 20<br/>dB when RMS conducted output power procedure is<br/>used.</li> <li>Enable hopping function of the EUT and then repeat<br/>step 2 and 3.</li> <li>Measure and record the results in the test report.</li> </ol> |
| Test Result:      | PASS   |
|                   |  |

Freq. = Emission frequency in MHz

Reading level  $(dB\mu V)$  = Receiver reading Corr. Factor (dB) = Antenna factor + Cable loss - Amplifier factor.

Measurement (dB $\mu$ V) = Reading level (dB $\mu$ V) + Corr. Factor (dB)

Limit  $(dB\mu V) = Limit$  stated in standard

Margin (dB) = Measurement (dB $\mu$ V) – Limits (dB $\mu$ V)

Member of the WSCT INC

World Standardization Certification & Testing Group (Shenzhen) Co., Ltd.

Certificate #5768.01

1. The emission levels of other frequencies are very lower than the limit and not show in test report.

Measurements were conducted from 1 GHz to the 10th harmonic of highest fundamental frequency.
 Data of measurement shown "---"in the above table mean that the reading of emissions is attenuated

Data of measurement shown "---"in the above table mean that the reading of emissions is attenuated more than 20 dB below the limits or the field strength is too small to be measured.

Measurements were conducted in all three modulation (GFSK, Pi/4 DQPSK, 8DPSK), and the worst case Mode (GFSK) was submitted only.
