FCC Rules and Regulations / Intentional Radiators

Operational in the Band 13.553-13.567 MHz

Part 15, Subpart C, Section 15.225

THE FOLLOWING "**MEETS**" THE ABOVE TEST SPECIFICATION

Formal Name: Zebra M2

Kind of Equipment: RFID Encoder for use in Zebra printers

Test Configuration: Limited Modular Approval (Tested at 120 vac, 60 Hz)

Model Number(s): M2

Model(s) Tested: M2

Serial Number(s): NA

Date of Tests: June 30 and July 5 & 6, 2006

Test Conducted For: Zebra Technologies Corporation
333 Corporate Woods Parkway
Vernon Hills, Illinois 60061

1.0 SUMMARY OF TEST REPORT

It was found that the Zebra M2, Model Number(s) M2, "meets" the radio interference conducted and radiated emission requirements of the FCC "Rules and Regulations", Part 15, Subpart C, Section 15.225 for operational in the 13.553-13.567 MHz Band.

This test report relates only to the items tested and contains the following number of pages.

Text: 113

2.0 INTRODUCTION

On June 30 and July 5 & 6, 2006, a series of radio frequency interference measurements was performed on Zebra M2, Model Number(s) M2, Serial Number: NA. The tests were performed according to the procedures of the FCC as stated in the "Methods of Measurement of Radio-Noise Emissions for Low-Voltage Electrical and Electronic Equipment in the Range of 9 kHz to 40 GHz" found in the American National Standards Institute, ANSI C63.4-2003. Tests were performed by personnel of D.L.S. Electronic Systems, Inc. who are responsible to Donald L. Sweeney, Senior EMC Engineer.

D.L.S. Electronic Systems, Inc. is a full service EMC/Safety Testing Laboratory accredited to ISO 17025. NVLAP Certificate and Scope can be viewed at <http://www.dlsemc.com/certificate>. Our facilities are registered with the FCC, Industry Canada, and VCCI.

3.0 OBJECT

The purpose of this series of tests was to determine if the test sample could meet the radio frequency interference emission requirements of the FCC "Rules and Regulations", Part 15, Subpart C, Sections 15.209 & 15.225 for Intentional Radiators operating in the Band 13.553-13.567 MHz.

4.0 TEST SET-UP

All emission tests were performed at D.L.S. Electronic Systems, Inc. and set up according to the American National Standards Institute, ANSI C63.4-2003, Section 8, (Figures 11a and 11b).

All emissions tests were performed with the test item placed on a 80 cm high rotating non-conductive table, located in the test room. Equipment normally operated on the floor was placed on a metal covered turntable which is flush with the surrounding conducting ground plane. The ground plane has an electrical isolation layer over its surface approximately 7 mm thick. The EUT is separated from the turntable ground plane by a non-conductive layer. The equipment under test was set up according to ANSI C63.4-2003, Sections 6, 7 and 8.

5.0 TEST EQUIPMENT (Bandwidths and Detector Function)

All preliminary data below 1000 MHz was automatically plotted using the HP Spectrum Analyzer or ESI 26/40 Fixed Tuned Receiver. The data was taken using Peak, Quasi-Peak or the Average Detector Functions as required. This information was then used to determine the frequencies of maximum emissions. Above 1000 MHz, final data was taken using the Average Detector.

Below 1000 MHz, final data was taken using the HP Spectrum Analyzer and/or ESI 26/40 Fixed Tuned Receiver. These plots were made using the Peak or Quasi-Peak Detector functions, with manual measurements performed on the questionable frequencies using the Quasi-Peak or the Average Detector Function of the Analyzer or ESI 26/40 Fixed Tuned Receiver as required. Above 1000 MHz, final data was taken using the Average Detector on the Spectrum Analyzer.

The bandwidths shown below are specified by ANSI C63.4-2003, Section 4.2.

Frequency Range	Bandwidth (-6 dB)
10 to 150 kHz	200 Hz
150 kHz to 30 MHz	9 kHz
30 MHz to 1 GHz	120 kHz
Above 1 GHz	1 MHz

A list of the equipment used can be found in Table 1. All primary equipment was calibrated against known reference standards with a verified traceable path to NIST.

6.0 AMBIENT MEASUREMENTS

For emissions measurements, broadband antennas and an EMI Test Receiver with a panoramic spectrum display are used. First the frequency range is scanned and displayed on the test receiver display. Next the scanned frequency range is divided into smaller ranges, and then it is manually tuned through to determine the emissions from the EUT. A headset or loudspeaker is connected to the test receiver's AM/FM demodulated output as an aid in detecting ambient signals and finding frequencies of significant emission from the EUT. If there is any doubt as to the source of the emission, it is further investigated by rotating the EUT, or by disconnecting the power from the EUT.

The EUT is set up in its typical configuration and operated in its various modes. For tabletop systems, cables are manipulated within the range of likely configurations. For floor-standing equipment, the cables are located in the same manner as the user would install them and no further manipulation is made. If the manner of cable installation is not known, or if it changes with each installation, cables or wires for floor-standing equipment shall be manipulated to the extent possible to produce the maximum level of emissions. For each mode of operation, the frequency spectrum is monitored. Variations in antenna height, antenna polarization, EUT azimuth, and cable or wire placement (each variable within bounds specified elsewhere) are explored to produce the emissions that have the highest amplitude relative to the limit. These methods are performed to the specifications in MP-5 or ANSI C63.4-2003, as appropriate.

7.0 DESCRIPTION OF TEST SAMPLE: (See also Paragraph 8.0)

7.1 Description:

Zebra M2 is a RFID encoder used for encoding RFID tags. The encoder is installed in Zebra printers. The RFID encoder operates at 13.56 MHz. It has the ability to switch between two magnetic loop antennas, depending on the tag type used.

7.2 PHYSICAL DIMENSIONS OF EQUIPMENT UNDER TEST

Length: 2 inches x Width: 2.7 inches x Height: .06 inches

7.3 LINE FILTER USED:

5 Volts DC Powered Device

7.4 INTERNAL CLOCK FREQUENCIES:

Switching Power Supply Frequencies:

NA

Clock Frequencies:

RFID Reader: 13.56 MHz & 12 MHz

7.5 DESCRIPTION OF ALL CIRCUIT BOARDS:

1. MP UHF RFID Encoder RF Board

PN: M2-MH

Company: Zebra Technologies Corporation
Model Tested: M2
Report Number: 12350

8.0 ADDITIONAL DESCRIPTION OF TEST SAMPLE:
(See also Paragraph 7.0)

1: There were no additional descriptions noted at the time of test.

This Zebra M2 was tested with two different sized Magnetic Loop Antennas. The printer was tested with the "Cutter Option" and tested without the "Cutter Option". The Zebra M2 was tested in "Continuous Transmit", "Continuous Receive/Standby" and "Printing".

I certify that the above, as described in paragraph 7.0, describes the equipment tested and will be manufactured as stated.

Report Number: 12350

APPENDIX A

1.0 CONDUCTED EMISSION MEASUREMENTS

The conducted emissions were measured over the frequency range from 150 kHz to 30 MHz in accordance with the power line measurements, as specified in ANSI C63.4-2003. Since the device is operated from the public utility lines, the 120 Vac, 60 Hz power leads, high and low sides were measured by connecting the measuring equipment to the appropriate meter terminal of the LISN. All signals were then recorded. The allowed levels for Intentional Radiators cannot exceed 250 μ V (47.96 dBuV) at any frequency between 150 kHz and 30 MHz, as stated in Section 15.207a.

APPENDIX A

2.0 FIELD STRENGTH OF SPURIOUS EMISSION MEASUREMENTS (SECTION 15.225a & b)

The radiated measurements made at D.L.S. Electronic Systems, Inc., for the Zebra M2, Model Number: M2, are shown in tabulated and graph form. Preliminary radiation measurements were performed at a 3 meter test distance with the limits adjusted linearly when required. The frequency range from 9 kHz to over 960 MHz, depending upon the fundamental frequency as stated in Part 15.33a, was automatically scanned and plotted at various angles.

Measurements for the Zebra M2 were made up to 1000 MHz, in accordance with Section 15.33a for Intentional Radiators with a fundamental frequency of 13.56 MHz. For intentional radiators, the frequency range to be investigated is determined by the lowest radio frequency generated by the device without going below 9 kHz, up to at least the tenth harmonic of the highest fundamental frequency or 1000 MHz, whichever is lower. At those frequencies where significant signals were detected, measurements were made at an open field test site, located at Genoa City, Wisconsin, FCC file number **31040/SIT**, to determine the actual radiation levels.

All signals in the frequency range of 9 kHz to 30 MHz were measured with a low frequency Loop Antenna as a pickup device. From 30 to 200 MHz, a Biconical Antenna or tuned dipoles were used and from 200 MHz to 1000 MHz, a Log Periodic or Tuned Dipoles were used. During the test the equipment was rotated and the antenna was raised and lowered from 1 meter to 4 meters to find the maximum level. In order to find maximum emissions, the cables were moved through all the positions the equipment would be expected to experience in the field. Tests were made in the vertical polarization with the Loop Antenna, rotated 360° around its vertical axis. Tests were also made in both the horizontal and vertical planes of polarization with the Biconical and Log Periodic. In each case, the table was rotated to find the maximum emissions.

When the equipment is out of limit at 3 meters, and the signals from the equipment at 30 meters cannot be recorded due to the background, a representative sample of these frequencies were re-measured at various distances such as 4, 5, 6, 8, 15 meters and the greatest distance that can be measured to demonstrate graphically that the emissions are dropping off and will be under the limit at the specified distance. All signals were then recorded. The allowed levels for Intentional Radiators in the 13.553 MHz to 13.567 MHz band shall not exceed 10,000 uV measured at 30 meters. The field strength of any emissions appearing outside of this band shall not exceed the radiated emissions limits shown in Section 15.209.

APPENDIX A

3.0 FREQUENCY STABILITY (Temperature) - (PART 2.1055a)

The frequency stability was measured from -20° to $+50^{\circ}$ centigrade at intervals of 10° centigrade throughout the range. Prior to each frequency measurement, the equipment was left alone for a sufficient period of time (approximately 30 minutes or more) to allow the components of the Zebra M2 oscillator circuitry to stabilize. The following information was taken:

ISO15693 EMISSION MASK

FREQUENCY STABILITY FOR TEMPERATURE VARIATION IN MHz (Section 4.5):

-20°	13.5609018
-10°	13.5609018
0°	13.5609018
$+10^{\circ}$	13.5609018
$+20^{\circ}$	13.5609018
$+30^{\circ}$	13.56078557
$+40^{\circ}$	13.56078557
$+50^{\circ}$	13.56078557

Worst Case Variance: = 116.23 Hz

As stated in RSS-GEN, Issue 1, Section 4.5, the Frequency Tolerance for this frequency range are as follows:

Frequency Tolerance: = .01%

Ambient Frequency: = 13.5609018 MHz

Limit = $13560901.8 * .01\%$ = **1356.1 Hz**

This is well within the specified limits.

NOTE:

See the following page(s) for the graph(s) of the actual measurement made:

8.0 FREQUENCY STABILITY (Voltage Variation) – (PART 2.1055d)

The frequency stability was measured at +20° centigrade by varying the primary supply voltage from 85% to 115% of nominal value for all equipment other than hand carried battery equipment.

ISO15693 EMISSION MASK

FREQUENCY STABILITY FOR VOLTAGE VARIATION (Section 4.5):

85% 13.5609018
100%
115% 13.5609018

This is well within the specified limits.

FREQUENCY STABILITY FOR HAND HELD DEVICES:

For handheld battery operated equipment (cannot be plugged into the power mains), the frequency stability tests were made using a new battery, eliminating the need to vary the power supply by $\pm 15\%$.

Fresh Battery versus Battery end point:

Frequency #1 NA
Frequency #2 NA
Frequency #3 NA

NOTE:

This test as not performed.

11.0 FREQUENCY STABILITY (Temperature) - (PART 2.1055a)

The frequency stability was measured from -20° to $+50^{\circ}$ centigrade at intervals of 10° centigrade throughout the range. Prior to each frequency measurement, the equipment was left alone for a sufficient period of time (approximately 30 minutes or more) to allow the components of the Zebra M2 oscillator circuitry to stabilize. The following information was taken:

FREQUENCY STABILITY

FREQUENCY STABILITY FOR TEMPERATURE VARIATION IN MHz (Section 4.5):

-20°	13.560403
-10°	13.560427
0°	13.560423
$+10^{\circ}$	13.560391
$+20^{\circ}$	13.560331
$+30^{\circ}$	13.560287
$+40^{\circ}$	13.560267
$+50^{\circ}$	13.560210

Worst Case Variance: = 217 Hz

As stated in RSS-GEN, Issue 1, Section 4.5, the Frequency Tolerance for this frequency range are as follows:

Frequency Tolerance: = .01%

Ambient Frequency: = 13.560330.55 MHz

Limit = $13560330.55 * .01\%$ = **1356.03 Hz**

This is well within the specified limits.

NOTE:

See the following page(s) for the graph(s) of the actual measurement made:

12.0 FREQUENCY STABILITY (Voltage Variation) – (PART 2.1055d)

The frequency stability was measured at +20° centigrade by varying the primary supply voltage from 85% to 115% of nominal value for all equipment other than hand carried battery equipment.

FREQUENCY STABILITY

FREQUENCY STABILITY FOR VOLTAGE VARIATION (Section 4.5):

85%	13.56030261
100%	
115%	13.56030261

This is well within the specified limits.

FREQUENCY STABILITY FOR HAND HELD DEVICES:

For handheld battery operated equipment (cannot be plugged into the power mains), the frequency stability tests were made using a new battery, eliminating the need to vary the power supply by $\pm 15\%$.

Fresh Battery verses Battery end point:

Frequency #1	NA
Frequency #2	NA
Frequency #3	NA

NOTE:

This test as not performed.
