According to §15.247(e)(i) and §1.1307(b)(1), systems operating under the provisions of this section shall be operated in a manner that ensures that the public is not exposed to radio frequency energy level in excess of the Commission's guidelines.  
According to KDB447498 D01 General RF Exposure Guidance V06  
The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances  $\leq 50$  mm are determined by:  
 $[(\text{max. power of channel, including tune-up tolerance, mW})/(\text{min. test separation distance, mm})] * [\sqrt{f(\text{GHz})}] \leq 3.0$  for 1-g SAR and  $\leq 7.5$  for 10-g extremity SAR, where  
f(GHz) is the RF channel transmit frequency in GHz;  
Power and distance are rounded to the nearest mW and mm before calculation;  
The result is rounded to one decimal place for comparison;  
The test exclusions are applicable only when the minimum test separation distance is  $\leq 50$  mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is  $< 5$  mm, a distance of 5 mm is applied to determine SAR test exclusion.  
We use 5mm as separation distance to calculate.

**Conclusion:**  
For the max result :  $0.50 \leq 3.0$  for 1-g SAR extremity SAR, No SAR is required.
