## **EXHIBIT 1**

## **GENERAL DESCRIPTION**

### 1.0 General Description

### 1.1 Product Description

The Equipment Under Test (EUT) is a 14-Channel FRS Transceiver operating at 462.5625 to 467.7125MHz. The EUT is powered by 6.0V battery (4 x 1.5V "AAA" alkaline or Ni-MH rechargeable batteries).

**Transmitter Portion** 

(i) Type of Emission : 5K7F3E

(ii) Frequency Range : 462.5625 to 467.7125MHz

(iii) Maximum Power Rating : 0.41W (iv) Antenna Type : Integral

The input current to final r.f. stage at 6.0V d.c. is 230mA

The brief circuit description is saved with filename: descri.pdf

#### 1.2 Related Submittal(s) Grants

This is an Application for Certification of the transmitter portion of a FRS Transceiver. The receiver section of the FRS Transceiver is subject to verification process.

#### 1.3 Test Methodology

Radiated emission measurements were performed according to the procedures in ANSI C63.4 (1992) and ANSI/TIA/EIA-603-1992. All measurement were performed in Open Area Test Sites. Preliminary scans were performed in the Open Area Test Sites only to determine worst case modes. For each scan, the procedure of maximizing emissions in Appendices D and E were followed. All Radiated tests were performed at an antenna the EUT distance of 3 meters, unless stated otherwise in the "Justification Section" of this Application.

#### 1.4 Test Facility

The open area test site and conducted measurement facility used to collect the emission data is located at Garment Centre, 576 Castle Peak Road, Kowloon, Hong Kong. The test facility and site measurement data have been fully placed on file with the FCC.

### **EXHIBIT 2**

## **SYSTEM TEST CONFIGURATION**

#### 2.0 System Test Configuration

#### 2.1 Justification

The device was configured for testing in a typical fashion (as a customer would normally use it). The device was placed on a turntable, which enabled the engineer to maximize emissions through its placement in the three orthogonal axes. When the radiated emissions are measured.

The device was powered by 4 x fully charged 1.5V "AAA" battery.

The frequency range from 30 MHz to 4.68 GHz was searched for spurious emissions from the device. Only those emissions reported were detected. All other emissions were at least 20 dB below the applicable limits.

#### 2.2 EUT Exercising Software

There was no special software to exercise the device. Once the unit is powered on, a signal is transmitted.

#### 2.3 Special Accessories

A special headset is provided by client for compliance of this device.

### 2.4 Measurement Uncertainty

When determining of the test conclusion, the Measurement Uncertainty of test has been considered.

### 2.5 Equipment Modification

Any modification installed previous to testing by RadioShack Corporation will be incorporated in each production model sold/leased in the United States.

No modification were installed by Intertek Testing Services.

# RF POWER OUTPUT

#### 3.0 RF Power Output (Section 2.1046(a))

### A. Equipment Used

| Equipment            | Brand Name      | Model No.        |
|----------------------|-----------------|------------------|
| Biconical Antenna    | CDI             | B300             |
| Test receiver        | Rohde & Schwarz | ESVS30           |
| RF Filter            | Tailithic       | 3VF              |
| Tuned Dipole Antenna | CDI             | Robert Antenna 4 |
| Signal Generator     | Maconi          | 2024             |

#### B. Testing Procedure

- 1. On a test site, the EUT shall be placed at 1.5m height on a turn table, and in the position closest to normal use as declared by the applicant.
- 2. The test antenna shall be oriented initially for vertical polarisation located 3m from EUT to correspond to the frequency of the transmitter.
- 3. The output of the test antenna shall be connected to the measuring receiver and the quasi-peak detector is used for the measurement.
- 4. The transmitter shall be switched on, if possible, without modulation and the measuring receiver shall be tuned to the frequency of the transmitter under test.
- 5. The test antenna shall be raised and lowered through the specified range of height until a maximum signal level is detected by the measuring receiver.

- 6. The transmitter shall then the rotated through  $360^{\circ}$  in the horizontal plane, until the maximum signal level is detected by the measuring receiver.
- 7. The test antenna shall be raised and lowered again through the specified range of height until a maximum signal level is detected by the measuring receiver.
- 8. The maximum signal level detected by the measuring receiver shall be noted.
- 9. The transmitter shall be replaced by a tuned dipole (substitution antenna).
- 10. The substitution antenna shall be orientated for vertical polarisation and the length of the substitution antenna shall be adjusted to correspond to the frequency of the transmitter.
- 11. The substitution antenna shall be connected to a calibrated signal generator.
- 12. If necessary, the input attenuator setting of the measuring receiver shall be adjusted in order to increase the sensitivity of the measuring receiver.
- 13. The test antenna shall be raised and lowered through the specified range of height to ensure that the maximum signal is received.
- 14. The input signal to the substitution antenna shall be adjusted to the level that produces a level detected by the measuring received, that is equal to the level noted while the transmitter radiated power was measured, corrected for the change of input attenuator setting of the measuring receiver.
- 15. The input level to the substitution antenna shall be recorded as power level in dBm, corrected for any change of input attenuator setting of the measuring receiver.
- 16. The measurement shall be repeated with the test antenna and the substitution antenna orientated for horizontal polarisation.
- 17. The measure of the effective radiated power is the larger of the two levels recorded, at the input to the substitution antenna, corrected for gain of the substitution antenna if necessary.

Notes: Negative sign in the margin column shows the value below limits.

Test Engineer: Ben W. K. Ho Date of Test: January 31, 2002

## **EXHIBIT 4**

# MODULATION CHARACTERISTICS

### 4.0 Modulation Characteristics

In order to satisfy the 95.637(a) requirement, Modulation Frequency Response and Modulation Limit Characteristics are attached in Exhibit 4.1 & 4.2.

Plots for each tests are saved with filename: mfr.pdf and mlc.pdf

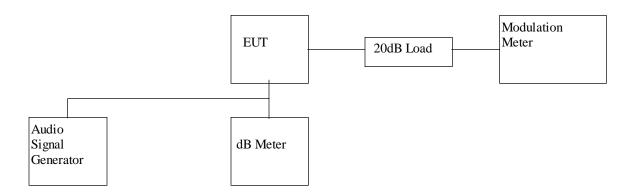

### 4.1 <u>Modulation Frequency Response</u>

### A. Test Equipment

| Equipment              | Brand Name         | Model No.  |
|------------------------|--------------------|------------|
| Audio Signal Generator | Leader             | LFG-1300S  |
| dB meter               | Leader             | LMV-182A   |
| 20 dB RF Load          | Bird               | 8304-200-N |
| Modulation Meter       | Marconi Instrument | 2945       |

### **B.** Testing Procedure

1) Set-up the test equipment in the following configuration:

- 2) Set the audio signal generator frequency to the sound pressure level 97.0dBSPL at the microphone of the EUT.
- 3) The frequency of the audio signal generator is changed form 200Hz to 5kHz.
- 4) Record the frequency deviation.

#### C. Test Result

Table 2

#### 4.2 <u>Modulation Limiting Characteristics (Section 2.1047(b))</u>

### A. Test Equipment

| Equipment              | Brand Name | Model No.  |
|------------------------|------------|------------|
| Audio Signal Generator | Leader     | LFG-1300S  |
| 20 dB RF Load          | Bird       | 8304-200-N |
| Modulation Meter       | Marconi    | 2950       |

### **B.** Testing Procedure

1) Set-up the test equipment in the following configuration:

- 2) Set the frequency of the audio signal generator to 500Hz and adjust the level from 47dBSPL to 127dBSPL.
- 3) Record the maximum value of plus or minus peak frequency deviation.
- 4) Repeat the above procedure with frequency 1000Hz, 2500Hz & 3125Hz.

#### C. Test Result

#### 4.3 Audio Low Pass Filter Response (Section 95.637(b))

#### A. Test Equipment

| Equipment              | Brand Name | Model No. |
|------------------------|------------|-----------|
| Audio Signal Generator | Leader     | LFG-1300S |
| dB meter               | Leader     | LMV-182A  |

### **B.** Testing Procedure

- 1) Connect the audio signal generator to the input of the post limiter low pass filter and the dB meter to the output of the post limiter low pass filter.
- 2) Apply a 1000 Hz tone from the audio signal generator and adjust the level per manufacturer's specifications. Record the dB level of the 1000 Hz tone as LEV<sub>REF</sub>.
- 3) Set the audio signal generator to the desired test frequency between 3000 Hz and the upper low pass filter limit. Record the dB level at the test frequency as LEV<sub>FREO</sub>.
- 4) Calculate the audio frequency response at the test frequency as:

 $low pass filter response = LEV_{FREQ} - LEV_{REF}$ 

5) Repeat the above procedure for all the desired test frequencies.

#### C. Test Result

For electronic filing, the audio low pass frequency response is saved with filename: lpf.pdf.

## **EXHIBIT 5**

## OCCUPIED BANDWIDTH

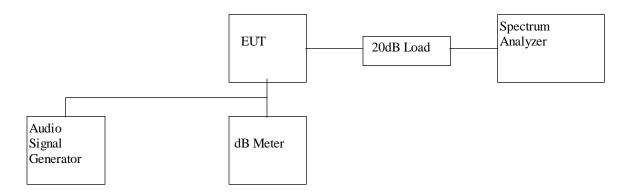

#### 5.0 Occupied Bandwidth (Section 95.633(c))

#### A. Test Equipment

| Equipment              | Brand Name      | Model No.  |
|------------------------|-----------------|------------|
| Audio Signal Generator | Leader          | LFG-1300S  |
| dB meter               | Leader          | LMV-182A   |
| 20 dB RF Load          | Bird            | 8304-200-N |
| Spectrum Analyzer      | Hewlett Packard | 8951EM     |

#### **B.** Testing Procedure

1) Set-up the test equipment in the following configuration:

- 2) Set the level of audio signal generator to obtain 16 dB greater than required for 50% modulation.
- 3) The occupied bandwidth is measured with the spectrum analyzer set at 5kHz/div scan and 10dB/div.

#### C. Test Result

The occupied Bandwidth is measured to be 5.7 kHz.

For the electronic filing, the bandwidth plot is saved with filename: bw.pdf

Test Engineer: Ben W. K. Ho

Date of Test: January 31, 2002

# **EXHIBIT 6**

# **SPURIOUS EMISSION**

## 6.0 Spurious Emission (Section 95.635)

In order to satisfy the 95.635 requirement, the spurious emission from the EUT are measured and shown in the Exhibit 6.1.

### 6.1 Field Strength of Spurious Radiation (Section 95.635)

### A. Test Equipment

| Equipment     | Brand Name      | Model No.            |
|---------------|-----------------|----------------------|
| Antenna       | CDI             | B100,B200,B300, Horn |
| Test receiver | Rohde & Schwarz | ESVS30               |
| RF Filter     | Tailithic       | 3VF                  |

### **B.** Testing Procedure

Radiated emission measurements were performed according to the procedures in ANSI C63.4(1992). All measurements were performed in Open Area Test Sites located at Roof Top of Garment Centre, 576 Castle Peak Road, Kowloon, Hong Kong.

## C. Radiated Emission Configuration Photograph

Worst Case Radiated Emission

For electronic filing, the radiated emission configurations photograph is saved with filename: Radiated photos.doc

#### C. Test Result

## RadioShack Corporation RadioShack 21-1863

## Table 4(a)

1. Unwanted emission from CARRIER ±6.25kHz to CARRIER ±31.25kHz

(Refer to the plots which is saved with filename: spurious.pdf)

|                               | <b>Unwanted emission</b> |            |
|-------------------------------|--------------------------|------------|
| Region                        | Channel 4                | Channel 11 |
| CARRIER ±6.25kHz to ±12.5kHz  | <25dB                    | <25dB      |
| CARRIER ±12.5kHz to ±31.25kHz | <35dB                    | <35dB      |

Table 4(b): Channel 4

| Frequency | Effective<br>Radiated | Transmission<br>Power | A ttenuation  | Limited     | M argin       |
