6.3 Measurement Setup

Mobile:

Portable:

Note:

- RF exposure assessment tests are conducted in a shielded room.
- Refer to the following test method description for the test distance between the edge of the charger and the measuring probe.
- As shown in the above picture, the test layout is not for the real object, only the requirements of the test layout listed in the standard requirements are presented, for reference only.
- The actual test EUT distinguishes the test type according to the requirements as shown in the figure above.

Any report having not been signed by authorized approver, or having been altered without authorization, or having not been stamped by the "Dedicated Testing/Inspection Stamp" is deemed to be invalid. Copying or excerpting portion of, or altering the content of the report is not permitted without the written authorization of AGC. The test results presented in the report apply only to the tested sample. Any objections to report issued by AGC should be submitted to AGC within 15days after the issuance of the test report. Further enquiry of validity or verification of the test report should be addressed to AGC by agc01@agccert.com.

6.4 Equipment Approval Considerations

No.	Requirements	Conditions of the EUT
1	WPT operating frequency (or frequencies).	110.5~205kHz
2	Number of radiating structure (Coil)	Only one coil
3	Conducted Power for each radiating structure	The maximum power is 5W
4	§ 2.1091-Mobile or § 2.1093-Portable demonstrated scenarios of operation, including RF exposure compliance information	Mobile and Portable Device
5	Maximum distance from the WPT transmitter at which, by design, a load can be charged (including slow-charging operations)	Directly charge with the client (mobile phone)

6.5 Measurement Procedure

6.5.1 For mobile RF exposure:

- The RF exposure test was performed on 360 degree turn table in anechoic chamber.
- E-field and H-field measurements should be taken with the probe geometric center located 20cm around the EUT and 20cm above the top surface of the master/client pair.
- The highest emission level was recorded and compared with limit as soon as measurement of each point (A, B, C, D, E) were completed.
- The EUT were measured according to the dictates of KDB 680106 D01v04

6.5.2 For portable RF exposure:

- The RF exposure test was performed on 360 degree turn table in anechoic chamber.
- The measurement probe was placed at test distance (from 0 cm to 20 cm, in 2 cm maximum increment) which is between the edge of the charger and the geometric center of probe.
- The highest emission level was recorded and compared with limit as soon as measurement of each point (A, B, C, D, E, F,) were completed.
- The EUT were measured according to the dictates of KDB 680106 D01v04

Any report having not been signed by authorized approver, or having been altered without authorization, or having not been stamped by the "Dedicated Testing/Inspection Stamp" is deemed to be invalid. Copying or excerpting portion of, or altering the content of the report is not permitted without the written authorization of AGC. The test results presented in the report apply only to the tested sample. Any objections to report issued by AGC should be submitted to AGC within 15days after the issuance of the test report. Further enquiry of validity or verification of the test report should be addressed to AGC by agc01@agccert.com.

Specific Assessment Methods:

- Test performed with all the radiating structures operating at maximum power at the same time.
- H-field measurements are taken along all three axes the device from 0cm~20cm in 2cm minimum increment for each edge surface of the host/client pair. If the center of the probe sensing element is more than 5mm from the probe outer edge, the field strengths need to be estimated for the positions that are not reachable.
- According to Calibration information and specification about WP400 Probe, The Probe WP400 Probe's sensitive elements center is located in the probe's center, and the distance from the sensitive elements center to the tip of probe is 6.25cm.
- For locations that cannot be reached by numerical calculations, the actual field strengths of 0 cm, 2 cm, 4 cm, and 6 cm need to be estimated.
- Use Biot-Savart Law formula theory to estimate the strength of the magnetic field that the measuring instrument cannot measure. According to Biot-Savart Law formula:

$$B = \frac{\mu_0 * I * N * R^2}{2 * (R^2 + x^2)^{3/2}}$$

$$B = \frac{\mu_0 * I * N}{2 * x}$$

- **B (Unit: A/m):** means H-field value;
- **μ_0** is space permeability; $\mu_0 = 4\pi * 10^{-7}$;
- **I (Unit: A):** A current element passing through a radiated coil;
- **R (Unit: m):** means the Radius of radiated coil, According to provided Antenna specification: $R = 40/2 = 20\text{mm} = 0.02\text{m}$;
- **Test Distance (Unit: m):** The distance from the sensing element of the probe to the edge of the device surface.
- **x (Unit: m):** means the center of the coil to the sensing elements of the probe. (For top & bottom side: $x = \text{test distance}$; For other side: $x = \text{test distance} + R$)
- **N:** Number of turns, according to providing "Antenna specification" files: $N = 11$.
- For validation purposes: If the value to show a 30% agreement between the mode and the probe measurements for the two closest points to the device surface, and with 2cm increments. Then this extrapolation method is reasonable.

Any report having not been signed by authorized approver, or having been altered without authorization, or having not been stamped by the "Dedicated Testing/Inspection Stamp" is deemed to be invalid.
