Note 1:

The 1-g and 10-g SAR test exclusion thresholds for 100 MHz to 6 GHz at test separation distances \leq 50 mm are determined by :

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]* $[\sqrt{f(GHz)}] \leq 3.0$ for 1-g SAR and ≤ 7.5 for 10-g extremity SAR, where

- f(GHz) is the RF channel transmit frequency in GHz
- Power and distance are rounded to the nearest mW and mm before calculation
- The result is rounded to one decimal place for comparison
- 3.0 and 7.5 are referred to as the numeric thresholds in the step 2 below

The test exclusions are applicable only when the minimum test separation distance is \leq 50 mm and for transmission frequencies between 100 MHz and 6 GHz. When the minimum test separation distance is < 5 mm, a distance of 5 mm according to 4.1f) is applied to determine SAR test exclusion.

Output Power:

Mode	lode Frequency Maximum output power to (MHz) antenna (mW)		SAR Test Exclusion Threshold (mW)		
Bluetooth LE	2 402	0.526	10		

Per FCC KDB 447498 D01v06, the SAR exclusion threshold for distances \leq 50mm is defined by the following equation :

[(max. power of channel, including tune-up tolerance, mW)/(min. test separation distance, mm)]* [$\sqrt{f}(GHz)$] ≤ 3.0

Base on the maximum conducted power of the antenna to use separation distance, SAR was not required;

Bluetooth LE : $[(0.526/5) * \sqrt{2.402}] = 0.163 (\le 3.0)$

Result : As a result of the calculation above, the SAR test is exempt.
