Nokia Global Product Compliance Laboratories is accredited by the National Voluntary Laboratory Accreditation Program (NVLAP®) for specific services, listed on the Scope of Accreditation, for: Electromagnetic Compatibility and Telecommunications. This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communiqué dated January 2009). NVLAP LAB CODE: 100275-0.

Nokia Global Product Compliance Laboratory represents to the client that the laboratory's accreditation or any of its calibration or test reports in no way constitutes or implies product certification, approval, or endorsement by NVLAP, NIST, or any agency of the U.S. Government.

Test Results: The EUT, as tested met the above listed Test Requirements. The decision rule employed is binary (Pass/Fail) based on the measured values without accounting for Measurement Uncertainty or any Guard Band. The measured values obtained during testing were compared to a value given in the referenced regulation or normative standard. Report copies and other information not contained in this report are held by either the product engineer or in an identified file at the Global Product Compliance Laboratory in New Providence, NJ.

1.1 Introduction

This Conformity test report applies to the AirScale MAA 64T64R 192AE B48 AEQM, hereinafter referred to as the Equipment Under Test (EUT).

1.2 Purpose and Scope

This document is to provide the testing data required for qualifying the EUT in compliance with FCC Part 96 measured in accordance with the procedures set out in Section 2.1033 (c) (14) of the Rules.

The purpose of this testing is to demonstrate compliance for **AirScale MAA 64T64R 192AE B48 - AEQM** product for a new FCC Product Certification under FCC ID: VBNAEQM-01. The AEQM is a LTE-TDD transceiver and operates in Band 48 Citizens Broadband Radio Service (CBRS) spectrum (3550-3700 MHz).

The AEQM supports 10MHz and 20 MHz single LTE carriers, plus 10+20 and 20+20 MHz multiple carriers and a maximum total output RF power capacity of 32W at its 64T/64R transmit ports. The AEQM also supports cross-polarized 32T/32R 4 streams per polarization and 64T/64R 8 streams per polarization MIMO operations.

1.3 EUT Details

1.3.1 Specifications

| Specification | 3GPP/FCC LTE compliant, TDD |
|---------------------------------|--|
| Frequency range | 3550 - 3700 MHz |
| Max. supported modulation | QPSK, 16QAM, 64QAM and 256 QAM |
| Number of TX/RX paths | 64T/64R and 32T32R |
| Polarization | Cross Polarization |
| Mode of operation | 16-Beam 64T64R and 8-Beam 32T32R MIMO |
| Occupied bandwidth OBW | 10/20/30/40 MHz |
| Maximum number of carriers | 2 |
| Support non-contiguous carriers | yes |
| Total average EIRP | 54.81 dBm |
| Max. output power | 0.27 w per TRX and 8.6 W total |
| Antenna configuration | 12, 8, 2 (±45° X-polarized) |
| Max. Antenna gain | 24.5dBi for 2-Beam 32T32R and 27.5 dBi for 2-Beam 64T64R with cross polarization |
| Horizontal beamwidth | 15° (boresight) |
| Vertical beamwidth | 6° (boresight) |
| Horizontal coverage angle | ±45° (3 dB), ±60° (5 dB) |
| Vertical steering angle | ±6° |
| Dimensions | 750 mm (H) x 450 mm (W) x 240 mm (D) |

| Volume | 81 | | |
|---------------------------------|---|--|--|
| Weight | 42.2 kg (without mounting brackets) | | |
| Supply voltage / Connector type | DC -40.5 V57 V / 2 pole connector | | |
| Power Consumption | 716 W typical (75% DL duty cycle, 30% RF load) 752 W max (75% DL duty cycle, 100% RF load) | | |

1.6 MEASUREMENT UNCERTAINTY

The results of the calculations to estimate uncertainties for the several test methods and standards are shown in the Table below. These are the worst-case values.

Worst-Case Estimated Measurement Uncertainties

| Standard, Method or Procedure | | Condition | Frequency MHz | Expanded Uncertainty (k=2) |
|-------------------------------|--|---------------------|----------------------|----------------------------------|
| a. | Classical Emissions, (e.g., ANSI C63.4, CISPR 11, 14, 22, etc., using ESHS 30, | Conducted Emissions | 0.009 - 30 | ±3.5 dB |
| | | Radiated Emissions | 30 MHz – 200MHz H | ±5.1 dB |
| | | (AR-6 Semi-Anechoic | 30 MHz – 200 MHz V | ±5.1 dB |
| | | Chamber) | 200 MHz - 1000 MHz H | ±4.7 dB |
| | | | 200 MHz – 1000 MHz V | ±4.7 dB |
| | | | 1 GHz - 18 GHz | ±3.3 dB |

| Antenna Port Test | Signal Bandwidth | Frequency Range | Expanded Uncertainty (k=2), Amplitude |
|-----------------------------------|---------------------|-------------------|--|
| | 10 Hz | 9 kHz to 20 MHz | |
| Occupied Bandwidth, Edge of Band, | 100 Hz | 20 MHz to 1 GHz | 1.78 dB |
| Conducted Spurious Emissions | 10 kHz to 1 MHz | 1 GHz to 10 GHz | 1./ o UD |
| | 1MHz | 10 GHz to 40 GHz: | |
| RF Power | 10 Hz to 20 MHz | 50 MHz to 18 GHz | 0.5 dB |

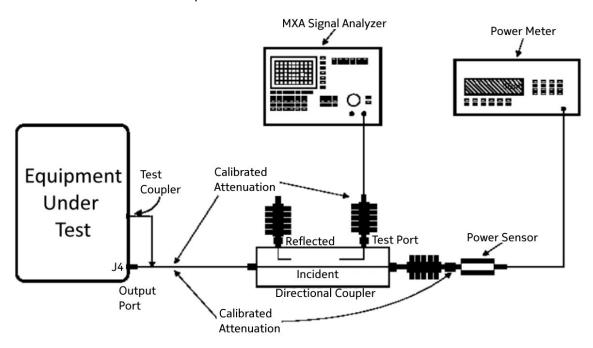

1.7 Executive Summary

| Requirement 47 CFR FCC Parts 2 and 96 | Description of Tests | Result |

2. FCC Section 2.1046 - RF Power Output and Power Spectral Density

2.1 RF Power Output

2.1.1 **Limits**

The FCC Part 96.41 requirement for Category B CBSD is that the Output Power of the EUT shall not exceed 47 dBm/10MHz EIRP.

Limit Calculation:

- a. Antenna Gain from Section 1.3.1
 - i. Antenna Gain for 2-Beam 64T64R = 27.5 dBi,
 - ii. Antenna Gain for 2-Beam 32T32R = 24.5 dBi;
- b. Multi-Beam Antenna Gain Reduction
 - i. 16-Beam Reduction = 10*log(1/16) dB = -12.04
 - i. 8-Beam Reduction = 10*log(1/8) dB = -9.03
- c. Effective Antenna Gain

8-Beam 32T32R 20+20MHz

- i. Effective Antenna Gain for 16-Beam 64T64R = 27.5 12.04 = 15.46 dBi
- ii. Effective Antenna Gain for 8-Beam 32T32R = 24.5 9.03 = 15.47 dBi

15.47

Operation Modes Effective FCC 96.41 **Total Conducted Conducted Output** Antenna Gain **EIRP Limit Output Power** Power Limit per (dBm/BW) Port (dBm/BW) (dBi) Limit (dBm/BW) 16-Beam 64T64R 10MHz 15.46 47 34.55 16.49 8-Beam 32T32R 10MHz 15.47 47 34.54 19.49 16-Beam 64T64R 20MHz 15.46 50.01 37.56 19.50 8-Beam 32T32R 20MHz 15.47 50.01 37.55 22.50 16-Beam 64T64R 10+20MHz 15.46 51.77 39.32 21.26 8-Beam 32T32R 10+20MHz 15.47 51.77 24.26 39.31 16-Beam 64T64R 20+20MHz 15.46 53.02 40.57 22.51

Table 2.1 RF Conducted Output Power Limits

The limits for 8-Beam 32T32R modes are higher than that for 16-Beam 64T64R modes. Therefore, the output power at the antenna ports for 8-Beam 32T32R modes was evaluated.

53.02

40.56

2.1.2 Results

Power measurements of the TDD transmit signal were conducted with an MXA Signal analyzer per KDB 971168 D01 and ANSI C63.26. The applied signal from the **AEQM**, met the recommended characteristics as defined in 3GPP TS 36.141 V16.9.0 (2021-04) Technical Specification Group Radio Access Network; Evolved Universal Terrestrial Radio Access (E-UTRA); Base Station (BS) conformance testing (Release 14). The Channel power was measured when the product was set to provide the maximum rated power at the antenna transmitting terminals. The output power of the EUT was measured per ANSI C63.26 methods and procedures and the Channel Power Measurement feature of the MXA Analyzer.

25.51

Product: AirScale MAA 64T64R 192AE B48 AEQM

The measured output power at antenna ports was documented in the table below. The Maximum Average RF Power Values are bolded in each configuration.

Table 2.2 RF Power Output Results (8-Beam 32T32R Modes)

| # of Carriers | Test Model | Modulation | TX Port | Channel Frequency MHz | Signal BW MHz | Channel Power dBm/BW | Channel Power Limit dBm/BW | Results |

Product: AirScale MAA 64T64R 192AE B48 AEQM

2.1.3 Maximum RF Conducted Output Power Plots

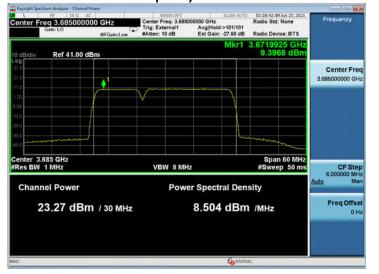

NOTE: Only a sample of the plots are used in this report. The full suite of raw data resides at the MH, New Jersey location.

Test Model 1.1 Modulation QPSK Mode 8-Beam 32T32R

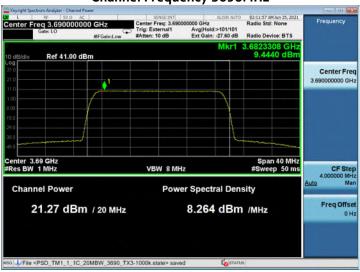

1CC, 10MHz BW Channel Frequency 3625MHz

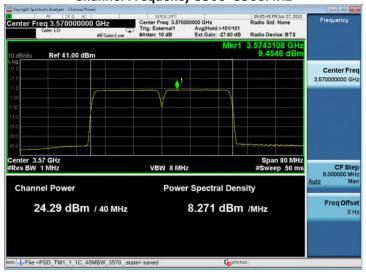

2CC, 10+20 MHz BW Channel Frequency 3675+3690MHz

1CC, 20MHz BW Channel Frequency 3690MHz

2CC, 20+20 MHz BW Channel Frequency 3560+3580MHz

Product: AirScale MAA 64T64R 192AE B48 AEQM

2.2 Power Spectral Density

2.2.1 **Limits**

The FCC Part 96.41 requirement for Category B CBSD is that the Power Spectral Density (PSD) of the EUT shall not exceed 37 dBm/MHz. The PSD per port limit was derived below.

Table 2.3 RF Conducted Power Spectrum Density Limits

| Operation Modes | Effective Antenna Gain (dBi) | FCC 96.41 PSD Limit (dBm/MHz) | Total Conducted PSD Limit (dBm/MHz) | Conducted PSD Limit per Port (dBm/MHz) |
|--------------------|---------------------------------|----------------------------------|--|--|
| 16-Beam 64T64R | 15.46 | 37 | 24.55 | 6.49 |
| 8-Beam 32T32R | 15.47 | 37 | 24.54 | 9.49 |

Both the power and PSD limits for 8-Beam 32T32R modes are 3dB higher than that for 16-Beam 64T64R modes, Therefore, the output power at the antenna ports for 8-Beam 32T32R modes was evaluated only.

2.2.2 Results

The PSD of the EUT was measured per ANSI C63.26 methods and procedures and the PSD Measurement feature of the MXA Analyzer. The PSD was measured when the product was set to provide the maximum rated power at the antenna transmitting terminals. The signal bandwidths, modulations and transmit channels identified in Table below were evaluated. The measured power spectral density level was documented in the table below.

The Maximum Average PSD Values are bolded in each configuration.

Table 2.4 Power Spectral Density Results (8-Beam 32T32R Modes)

| # of Carriers | Test Model | Modulation | TX Port | Channel Frequency MHz | Signal BW MHz | PSD Limit dBm/MHz | PSD dBm/MHz | PSD Results Pass/Fail |

| 2 (Contiguous) | 1.1 | QPSK | 3 | 3625+3645 | 20+20 | 9.49 | 9.3219 | Pass |
| 2 (Contiguous) | 1.1 | QPSK | 3 | 3670+3690 | 20+20 | 9.49 | 9.3855 | Pass |

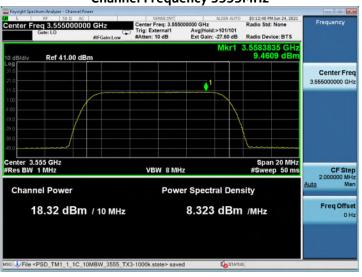

Product: AirScale MAA 64T64R 192AE B48 AEQM

2.2.3 Maximum Conducted PSD Plots

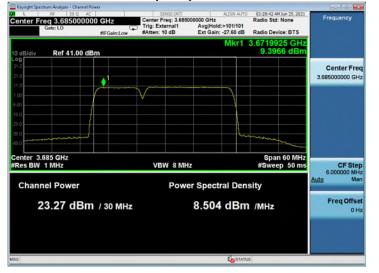

NOTE: Only a sample of the plots are used in this report. The full suite of raw data resides at the MH, New Jersey location.

Test Model 1.1 Modulation QPSK Mode 8-Beam 32T32R

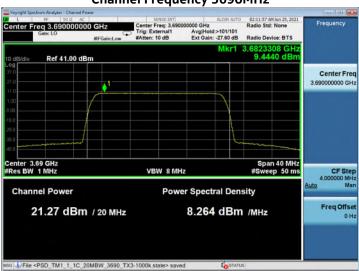

1CC, 10MHz BW Channel Frequency 3555MHz

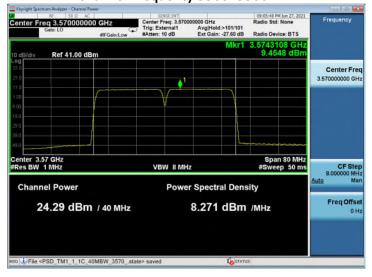

2CC, 10+20 MHz BW Channel Frequency 3675+3690MHz

1CC, 20MHz BW Channel Frequency 3690MHz

2CC, 20+20 MHz BW Channel Frequency 3560+3580MHz

Product: AirScale MAA 64T64R 192AE B48 AEQM

2.3 EIRP Compliance

As stated above, the EUT supports two operation modes:

- 1) 16-Beam 64T64R with two polarizations and
- 2) 8-Beam 32T32R with two polarizations.

Due to the fact that 8-Beam 32T32R mode allows higher conducted power per port. Therefore, only the output power levels for 8-Beam 32T32R modes with various channel bandwidths were evaluated in Section 2.1.

Table 2.5 Maximum Total EIRP Measured

| Operation Mode | Maxi Output Power per Port* (dBm) | Maxi Total Conducted Output Power (dBm) | Effective Antenna Gain (dBi) | Total EIRP (dBm/W) | Total EIRP Limit (dBm) | Results |
|-------------------------|---|---|------------------------------------|-----------------------|------------------------------|---------|
| 8-Beam 32T32R 10MHz | 18.33 | 33.38 | 15.47 | 48.85/76.7 | 50.0 | Pass |
| 8-Beam 32T32R 20MHz | 21.27 | 36.32 | 15.47 | 51.79/151.0 | 53.0 | Pass |
| 8-Beam 32T32R 10+20 MHz | 23.27 | 38.32 | 15.47 | 53.79/239.3 | 54.8 | Pass |
| 8-Beam 32T32R 20+20 MHz | 24.29 | 39.34 | 15.47 | 54.81/302.7 | 56.0 | Pass |

^{*}From Table 2.4

The sample calculation for the maximum EIRP as follows,

The maximum Conducted Output Power per port = 24.29 dBm;

The maximum Total Conducted Output Power = 24.29 + 10 x log (32) = 39.34 dBm;

The maximum total EIRP = 39.34 + 15.47 = 54.81 dBm.

2.4 Peak-to-Average Power Ratio (PAPR)

The Peak-to-Average Power Ratio (PAPR) was evaluated per ANSI C63.26 for 8-Beam 32T32R with 5, 10, 10+20, and 20+20 MHz bandwidth. The PAPR values of all carriers measured are below 13dB.

Table 2.6 Peak to Average Power Ratio (8-Beam 32T32R)

| # of Carriers | Test Model | Modulation | TX Port | Channel Frequency MHz | Center Frequency MHz | Signal BW MHz | PAR at 0.1% Limit - 13 dB |
|--------------------|---------------|------------|------------|--------------------------|-------------------------|------------------|------------------------------|

4. FCC Section 2.1049 - Occupied Bandwidth/Edge of Band Emissions

4.1 Occupied Bandwidth

In 47CFR 2.1049 the FCC requires:

"The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable."

This required measurement is the 99% Occupied Bandwidth, also called the designated signal bandwidth and needs to be within the parameters of the products specified emissions designator. During these measurements it is customary to evaluate the Edge of Band emissions at block/band edges.

Part 96.41e(3) specified that The fundamental emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

The transmitted signal occupied bandwidth was measured using a Keysight MXA Signal Analyzer. All emissions were within the parameters as required. The 8-Beam 32T32R modes have higher conducted RF output power per port, therefore, 8-Beam 32T32R modes were used for occupied bandwidth and band edge emissions evaluations.

4.2 Edge of band Emissions

47CFR 96.41 (e)(1) (i) and KDB 940660 D01 Section 3.2 (b)(6) specified that the limits for the emissions outside the fundamental are as follows.

- within 0 MHz to 10 MHz above and below the assigned channel \leq -13 dBm/MHz,
- greater than 10 MHz above and below the assigned channel \leq -25 dBm/MHz,
- any emission below 3530 MHz and above 3720 MHz \leq -40 dBm/MHz.

47CFR 96.41 (e)(3) and KDB 940660 D01 Section 3.2 (b)(6) specified stated that (i) Compliance with this provision is based on the use of measurement instrumentation employing a resolution bandwidth of 1 megahertz or greater. However, in the 1 megahertz bands immediately outside and adjacent to the licensee's authorized frequency channel, a resolution bandwidth of no less than one percent of the fundamental emission bandwidth may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full reference bandwidth (*i.e.*, 1 MHz or 1 percent of emission bandwidth, as specified). The fundamental emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. (ii) When measuring unwanted emissions to demonstrate compliance with the limits, the CBSD and End User Device nominal carrier frequency/channel shall be adjusted as close to the licensee's authorized frequency block edges, both upper and lower, as the design permits. (iii) Compliance with emission limits shall be demonstrated using either average (RMS)-detected or peak-detected power measurement techniques.

KDB 940660 D01 Section 3.2 (b)(6) specified that measurements must be performed for low, mid, and high channels. It is acceptable to apply the procedures in Section 5.7 of ANSI C63.26-2015. When antenna-port conducted measurements are performed to demonstrate compliance to the applicable unwanted emission limits (Section 2.1051), a separate radiated measurement is required to detect spurious emissions that may be radiated directly from the cabinet, control circuits, power leads, or intermediate circuit elements under normal conditions of installation and operation (Section 2.1053). The Section 96.41(e) limits generally also apply to radiated unwanted emissions.

The Edge of Band emissions of the EUT at the external antenna connector (EAC) were measured using a Keysight MXA Signal Analyzer. The RF power level was continuously measured using a RF broadband power meter. The RF output from the EAC port to signal analyzer was reduced (to an amplitude usable by the signal analyzer) by using a calibrated attenuator and test coupler. The path attenuation was offset on the display and the signal for the carrier was adjusted to the corrected RF power level for the resolution bandwidth used for the transmit signal. All mask values were adjusted based upon the designated signal bandwidth and measurement bandwidths. The Top of Mask corresponds to the set rated power level as confirmed by the RF power meter.

5. FCC Section 2.1051 - Spurious Emissions at Transmit Antenna Port

This test measures the emissions of spurious signals which may come from harmonic, parasitic, intermodulation and frequency conversion products and are outside the necessary bandwidth but excludes Edge-of-Band emissions.

5.1 Section 2.1051 Spurious Emissions at Antenna Terminals

Spurious Emissions at the antenna terminals were investigated per 47CFR Section 2.1057(a)(1) over the frequency range of 9 KHz to 38 GHz which is beyond the 10th harmonic of the carrier frequency. A test coupler and/or attenuator which incorporates a low intermod broadband RF attenuator was used to reduce the transceiver's amplitude to a level usable by the spectrum analyzer.

The spurious measurements were made using a PC based automated test system which controls either a MXA Signal Analyzer or a Rohde & Schwarz ESU-40 Test Receiver/ Spectrum Analyzer. These measurements are performed in compliance with ANSI C63.26 and our ISO17025 process. The measurement meets the ANSI C63.26 requirements in paragraphs 5.2.4.4.1 and 5.7 which requires that the number of points in the sweep be > 2 × Span/RBW.

The required emission limitation specified in **47CFR 96.41 (e)** was applied to these tests. Based upon the criterion given in Section 96 of the Code, the required emission limit for emissions outside a licensee's frequency block is:

47CFR 96.41 (e)(2) Additional protection levels. Notwithstanding paragraph (d)(1) of this section, the conducted power of any emissions below 3530 MHz or above 3720 MHz shall not exceed -40dBm/MHz. In order to account for the spectral adding of identical signals from the primary and diversity ports, per KDB 662911 D01 Multiple Transmitter Output v01r01, the level needs be adjusted by 10LOG(n) where n= number of outputs.

The adjustment for $n=64 \rightarrow 10LOG (64) = 18.06 dB$

Therefore, the limit for emissions >1 MHz outside a licensee's frequency block when measured with a RBW of 1 MHz is:

-40 dBm - 18.06 dB = -58.06 dBm for 64x MIMO

Product: AirScale MAA 64T64R 192AE B48 AEQM

5.2 Spurious Emissions at Antenna Terminals Results

6. Section 2.1053 - Measurement Required: Field Strength of Spurious Radiation

The field strength measurements of radiated spurious emissions were made in a FCC registered 3-meter semi-anechoic chamber AR-6, (FCC Registration Number: 395774) **NVLAP** Lab Code: 100275-0 and IC (Filing Number: 6933F-5) which is maintained by Nokia Bell Labs in Murray Hill, New Jersey.

6.1 Spurious Radiation and Radiated Emissions Requirements.

This product meets Parts 2,15 and 96 requirements. FCC Part 15 Class B require emissions to be below 54.5 dBuV/m at 3m.

47CFR 96.41 (e)(1) (i) and KDB 940660 D01 Section 3.2 (b)(6) specified that the limits for the emissions outside the fundamental are as follows.

- within 0 MHz to 10 MHz above and below the assigned channel \leq -13 dBm/MHz,
- greater than 10 MHz above and below the assigned channel \leq -25 dBm/MHz,
- any emission below 3530 MHz and above 3720 MHz \leq -40 dBm/MHz.

Title 47CFR section 2.1053 contains the requirements for the levels of spurious radiation as a function of the EIRP of the unmodulated carrier. The reference level for the unmodulated carrier is calculated as the field produced by an isotropic radiator excited by the transmitter output power according to the following relation taken from Reference Data for Radio Engineers, page 27-7, 6th edition, IT&T Corp.

$E = [(30*EIRP)^{1/2}] / R$

```
Where: E = Field Intensity in Volts/ meter R = Distance in meters = 3 m P = Emission Power in Watts  
Hence,  E \left( dB\mu V/m \right) = EIRP \left( dBm \right) - 20 \log d \left( m \right) + 104.77.  For EIRP = -13dBm/MHz, E = 82.2 \ dB\mu V/m, For EIRP = -25dBm/MHz, E = 70.2 \ dB\mu V/m, For EIRP = -40dBm/MHz, E = 55.2 \ dB\mu V/m.
```

The field strength of radiated spurious emissions measured was determined by

```
E(dB\mu V/m) = V_{meas}(dB\mu V) + Cable Loss (dB) + Antenna Factor (dBi/m).
```

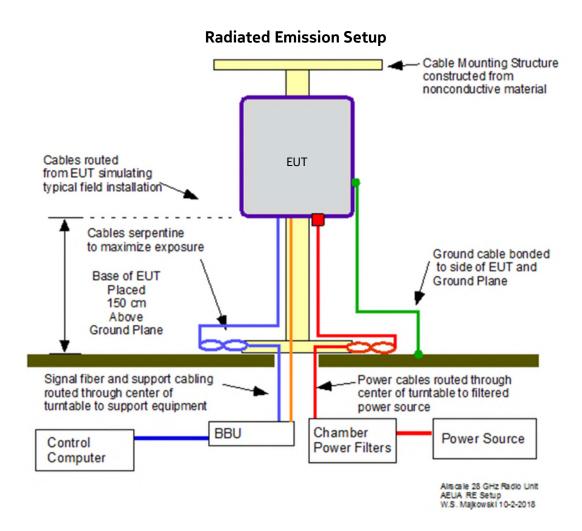

Field strength measurements of radiated spurious emissions were made in the 3m semi-anechoic chamber, AR-6 as detailed above. The recommendations of ANSI C63.4 and ANSI C63.26 were followed for EUT testing setup, cabling, and measurement approach and procedures. All the measurement equipment used, including antennas, was calibrated in accordance with ISO 9001 process. The EUT setup diagram is given in the Figure 4.5.

Below 18GHz, FCC Part 15 Class B limit 54.5 dBuV/m was used which is worse than FCC Part 96 limit. Above 18GHz, the limit 55.2 dBuV/m was used.

Product: AirScale MAA 64T64R 192AE B48 AEQM

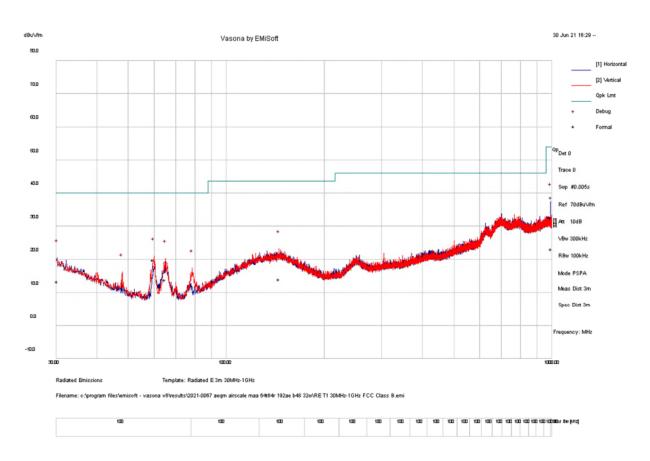

6.2 Field Strength of Spurious Radiation Results:

This product meets Part 96 Requirements. For the Title 47CFR section 96.41(e) and 2.1053 test, the field strength of any spurious radiation, measured at 3m, is required to be less than $55.2 \, \text{dB}_{\mu} \text{V/meter}$. Emissions equal to or less than $35.2 \, \, \text{dB}_{\mu} \text{V/meter}$ are not reportable and may be verified using field strength measurements with broadband antennas.

Note: Preview data was measured using a peak detector to identify frequencies of interest for formal measurement. Formal data consist of all frequencies in the preview list within 6 dB of specification limit or the top six frequencies. Failure in preview data does not necessarily constitute failure in formal data.

7. FCC Section 2.1055 - Measurement of Frequency Stability

Frequency Stability testing was completed on AEQM Unit with Center Frequency 3560 MHz. Testing was performed from 6/4/2021 – 6/7/2021, which was located in the T-6 Thermal chamber of the Global Product Compliance Laboratory (GPCL) test facility located in Building 4, Room 4-280, Murray Hill, NJ, by Joe Bordonaro from GPCL.

The temperatures to which the UUT were subjected ranged from a high temperature of $+50^{\circ}$ C system ambient to a low temperature of -30° C system ambient with measurements recorded at $+20^{\circ}$ C, $+50^{\circ}$ C, and -30° C.

Frequency Stability performance was verified by measuring Frequency Tolerance using an MXA Signal Analyzer. Frequency Tolerance is a measurement of the difference between the actual transmit frequency and the assigned frequency (3560 MHz).

Frequency Block Tested: <u>AEQM (CF = 3560MHz)</u>

Baseline Measurement at +25°C

| Transmit Frequency Deviation a | t +25°C at 100% of Nominal Voltage, -48VDC |
|--------------------------------|--|
| Time | Transmit Carrier Deviation |
| (minutes) | (Hz) |
| 0 | +3.8750 |

8. NVLAP Certificate of Accreditation

United States Department of Commerce National Institute of Standards and Technology

Certificate of Accreditation to ISO/IEC 17025:2017

NVLAP LAB CODE: 100275-0

Nokia, Global Product Compliance Lab

Murray Hill, NJ

is accredited by the National Voluntary Laboratory Accreditation Program for specific services, listed on the Scope of Accreditation, for:

Electromagnetic Compatibility & Telecommunications

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017.

This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communique dated January 2009).
